THE HAMILTONIAN EXTENDED KRYLOV SUBSPACE METHOD

PETER BENNER†, HEIKE FAßBENDER‡, AND MICHEL-NIKLAS SENN‡

Abstract. An algorithm for constructing a \( J \)-orthogonal basis of the extended Krylov subspace \( K_{r,s} = \text{range}\{u, Hu, H^2u, \ldots, H^{2r-1}u, H^{-1}u, H^{-2}u, \ldots, H^{-2s}u\} \), where \( H \in \mathbb{R}^{2n \times 2n} \) is a large (and sparse) Hamiltonian matrix is derived (for \( r = s + 1 \) or \( r = s \)). Surprisingly, this allows for short recurrences involving at most five previously generated basis vectors. Projecting \( H \) onto the subspace \( K_{r,s} \) yields a small Hamiltonian matrix. The resulting HEKS algorithm may be used in order to approximate \( f(H)u \) where \( f \) is a function which maps the Hamiltonian matrix \( H \) to, e.g., a (skew-)Hamiltonian or symplectic matrix. Numerical experiments illustrate that approximating \( f(H)u \) with the HEKS algorithm is competitive for some functions compared to the use of other (structure-preserving) Krylov subspace methods.

Key words. (Extended) Krylov Subspace, Hamiltonian, Symplectic, Matrix function evaluation.

AMS subject classifications. 65F25, 65F50, 65F60, 15A23.

1. Introduction. Let \( H \in \mathbb{R}^{2n \times 2n} \) be a nonsingular (large-scale) Hamiltonian matrix, that is \( J_nH = (J_nH)^T \), where \( J_n = \begin{bmatrix} 0 & I_n \\ -I_n & 0 \end{bmatrix} \in \mathbb{R}^{2n \times 2n} \) and \( I_n \) is the \( n \times n \) identity matrix. We are interested in computing a \( J \)-orthogonal basis of the extended Krylov subspace

\[
K_{r,s} := K_{2r}(H, u) + K_{2s}(H^{-1}, H^{-1}u) = \text{range}\{u, Hu, H^2u, \ldots, H^{2r-1}u, H^{-1}u, H^{-2}u, \ldots, H^{-2s}u\},
\]

where \( u \in \mathbb{R}^{2n} \) and either \( r = s + 1 \) or \( r = s \). That is, assuming

\[
\text{dim} K_{2r}(H, u) = 2r \quad \text{and} \quad \text{dim} K_{2s}(H^{-1}, H^{-1}u) = 2s,
\]

we are looking for a matrix \( S_{r+s} \in \mathbb{R}^{2n \times 2(r+s)} \) with \( J \)-orthonormal columns \( (S_{r+s}^T J_n S_{r+s} = J_{r+s}) \) such that the columns of \( S_{r+s} \) span the same subspace as \( K_{2r}(H, u) + K_{2s}(H^{-1}, H^{-1}u) \).

Extended Krylov subspaces

\[
\text{range}\{b, A^{-1}b, Ab, A^{-2}b, A^2b, \ldots, A^{-k}b, A^k b\} = K_k(A, b) + K_k(A^{-1}, A^{-1}b),
\]

for general nonsingular matrices \( A \in \mathbb{C}^{n \times n} \) and a vector \( b \in \mathbb{C}^n \) have been used for the numerical approximation of \( f(A)b \) for a function \( f \) and a large matrix \( A \) at least since the late 1990s mainly inspired by [8, 18]. In case an orthogonal matrix \( V \) has been constructed such that \( \text{range}(V) = K_k(A, b) + K_k(A^{-1}, A^{-1}b) \), an approximation to \( f(A)b \) can be obtained as

\[
f(A)b \approx Vf(V^TAV)V^Tb.
\]

More on functions of matrices, the computation of \( f(A)b \) and the approximation of \( f(a)b \) via Krylov subspace methods can be found in the all-encompassing monograph [17].

The Hamiltonian extended Krylov subspace method

The idea of constructing a J-orthogonal basis for the extended Krylov subspace $K_{r,s}$ (1.1) has been first considered in [23] in the context of approximating $\exp(H)u$. The Hamiltonian Extended Krylov Subspace (HEKS) method presented in [23] is a straightforward adaption of the algorithm for computing an orthogonal basis of an extended Krylov subspace described in [18]. Our main finding in this paper is the observation that the HEKS algorithm allows for a short recurrence to generate $S_{r+s}$.

We will explore the use of an J-orthogonal basis $S_{r+s}$ of the extended Krylov subspace $K_{r,s}$ (1.1) for approximating $f(H)u$ for a (large-scale) Hamiltonian matrix $H$ and a vector $u \in \mathbb{R}^{2n}$. Following the idea from (1.2), we have

$$f(H)u \approx S_{r+s} f(H_{r+s}) J_{r+s}^T S_{r+s}^T J_n u,$$

where $H_{r+s} = J_{r+s}^T S_{r+s}^T J_n H S_{r+s} \in \mathbb{R}^{2(r+s) \times 2(r+s)}$ is a Hamiltonian matrix. That is, we can preserve the rich structural information inherent to the Hamiltonian structure of the matrix $H$. This would not be possible by computing a standard (orthogonal) basis $V \in \mathbb{R}^{2n \times 2(r+s)}$ of $K_{r,s}$ as the matrix product $V^T H V$ will in general not be a Hamiltonian matrix even if $H$ is Hamiltonian. Hence, the HEKS algorithm may be used in particular in order to approximate $f(H)u$ where $f$ is a function which maps the Hamiltonian matrix $H$ to a structured matrix such as a (skew-)Hamiltonian or symplectic matrix. Such a structure-preserving approximation of $f(H)u$ is, e.g., important in the context of symplectic exponential integrators for Hamiltonian systems, see, e.g., [9, 13, 22, 23]. A structure-preserving approximation of $f(H)u$ may also be computed using, e.g., an J-orthogonal basis $S_{2k}$ of the standard Krylov subspace range$\{u, Hu, H^2 u, \ldots, H^{2k-1} u\}$. Such a basis can be generated by the Hamiltonian Lanczos method [4, 5, 26]. Both approaches will be compared later on.

The paper is structured as follows: Section 2 summarizes some basic well-known facts about Hamiltonian and J-orthogonal matrices. In Section 3, the general idea of generating the desired J-orthogonal basis $S_{r+s}$ of (1.1) as proposed in [23] is sketched. Then, it is noted that the projected matrices $H_{r+s} = J_{r+s}^T S_{r+s}^T J_n H S_{r+s}$ and $J_{r+s}^T S_{r+s}^T J_n H^{-1} S_{r+s}$ have at most 10$k$, resp. 10$k+2$, nonzero entries. The details are given in Section 4 and in Section 5. The resulting efficient HEKS algorithm using short recursions is summarized in Section 6. The rather long and technical constructive proof for our claim is deferred to the Appendix A. In Section 7, the approximation of $f(H)u$ using the HEKS algorithm is compared to the approximation by the extended Krylov subspace method [19] and by the Hamiltonian Lanczos method [5].

2. Preliminaries. Here, we list some properties of Hamiltonian and J-orthogonal matrices useful for the following discussion.

1. $J_n = \begin{bmatrix} 0 & I_n \\ -I_n & 0 \end{bmatrix} \in \mathbb{R}^{2n \times 2n}$ is orthogonal and skew-symmetric, $J_n^T = J_n^{-1} = -J_n$.
2. Let $H \in \mathbb{R}^{2n \times 2n}$. $H$ is Hamiltonian if and only if there exist matrices $E, B = B^T, C = C^T \in \mathbb{R}^{n \times n}$ such that

$$H = \begin{bmatrix} E & B \\ C & -E^T \end{bmatrix}.$$

3. Let $H \in \mathbb{R}^{2n \times 2n}$ be a nonsingular Hamiltonian matrix. Then $H^{-1}$ is Hamiltonian as well.
4. The eigenvalues of a Hamiltonian matrix $H$ occur in pairs $\{\lambda, -\lambda\}$ if $\lambda$ is real or purely imaginary, or in quadruples $\{\lambda, \bar{\lambda}, -\lambda, -\bar{\lambda}\}$ otherwise. That is, the spectrum of a Hamiltonian matrix is symmetric with respect to both the real and the imaginary axis.
5. A matrix $S \in \mathbb{R}^{2n \times 2n}$ is called symplectic if $S^T J_n S = J_n$. Its columns are J-orthogonal.
6. Let $S \in \mathbb{R}^{2n \times 2n}$ be a symplectic matrix. Then, $S^{-1} = J_n^T S^T J_n$ is symplectic as well.
7. Let $H \in \mathbb{R}^{2n \times 2n}$ be a Hamiltonian matrix and $S \in \mathbb{R}^{2n \times 2n}$ be a symplectic matrix. Then, $S^{-1} HS$ is a Hamiltonian matrix.
8. Let $S \in \mathbb{R}^{2n \times 2m}$, $m \leq n$, have $J$-orthogonal columns, $S^T J_n S = J_m$. Let $H \in \mathbb{R}^{2n \times 2n}$ be Hamiltonian.

(a) The matrix $J_m^T S^T J_n$ is the left inverse of $S$, $J_m^T S^T J_n S = I_{2m}$.
(b) The matrix $(J_m^T S^T J_n)HS$ is Hamiltonian.

Numerous further properties of the sets of these matrices (and their interplay) have been studied in the literature, see, e.g., [20] and the references therein. In particular, $J_n$ induces a skew-symmetric bilinear form $\langle \cdot, \cdot \rangle_{J_n}$ on $\mathbb{R}^{2n}$ defined by $\langle x, y \rangle_{J_n} = y^T J_n x$ for $x, y \in \mathbb{R}^{2n}$. Hamiltonian matrices are skew-adjoint with respect to the bilinear form $\langle \cdot, \cdot \rangle_{J_n}$, while symplectic matrices are orthogonal with respect to $\langle \cdot, \cdot \rangle$. The $2n \times 2n$ symplectic matrices form a Lie group, the $2n \times 2n$ Hamiltonian matrices the associated Lie algebra.

Assume that a matrix $S_k = [V_k \ W_k] \in \mathbb{R}^{2n \times 2k}$ with $J$-orthogonal columns is given with $V_k = [v_1 \ v_2 \ \cdots \ v_k]$ and $W_k = [w_1 \ w_2 \ \cdots \ w_k] \in \mathbb{R}^{2n \times k}$. Two additional vectors $x, J_n x \in \mathbb{R}^{2n}$ can be added to $S_k$ to generate a matrix $S_{k+1} = [V_{k+1} \ W_{k+1}] \in \mathbb{R}^{2n \times 2k+2}$ with $J$-orthogonal columns by $J$-orthogonalizing the vectors $x$ and $J_n x$ against all column vectors $v_j, w_j$ of $S_k$ via
\[
    v_{k+1} = x - S_k J_k^T S_k^T J_n x, \\
    w_{k+1} = (J_n v_{k+1}) - S_k J_k^T w_k^T J_n (J_n v_{k+1}), \\
    w_{k+1} = w_{k+1}/(|v_{k+1}^T J_n w_{k+1}|).
\]

3. Idea of the HEKS algorithm. Let a Hamiltonian matrix $H \in \mathbb{R}^{2n \times 2n}$ and a vector $u_1 \in \mathbb{R}^{2n}$, $\|u_1\|_2 = 2$, be given. Assume that $\dim K_{2r}(H, u_1) = 2r$ and $\dim K_{2s}(H^{-1}, H^{-1} u_1) = 2s$. The goal is to construct a matrix $S_{r+s} \in \mathbb{R}^{2n \times 2(r+s)}$ with $J$-orthonormal columns $(S_{r+s}^T J_n S_{r+s} = J_{r+s})$ such that the columns of $S_{r+s}$ span the same subspace as $K_{2r}(H, u_1) + K_{2s}(H^{-1}, H^{-1} u_1)$.

In [23], it is suggested to construct the matrix $S_{r+s}$ in the following way (assuming that no breakdown occurs):

1. We start with the two vectors in $K_2(H, u_1)$ and construct
\[
    S_1 = [u_1 \ | \ v_1] \in \mathbb{R}^{2n \times 2},
\]
with $S_1^T J_n S_1 = J_1$ and range$(S_1) = K_2(H, u_1)$. This corresponds to the choice $r = 1, s = 0$.

2. Thereafter we take the two vectors in $K_2(H^{-1}, H^{-1} u_1)$ and construct
\[
    S_2 = [y_1 \ u_1 \ | \ x_1 \ v_1] = [Y_1 \ U_1 \ | \ X_1 \ V_1] \in \mathbb{R}^{2n \times 4},
\]
with $S_2^T J_n S_2 = J_2$ and range$(S_2) = K_2(H, u_1) + K_2(H^{-1}, H^{-1} u_1)$. This corresponds to the choice $r = s = 1$.

We proceed in this fashion by alternating between the subspaces $K_{2r}(H, u_1)$ and $K_{2s}(H^{-1}, H^{-1} u_1)$. Assume that a matrix
\[
    S_{2k} = [Y_k \ U_k \ | \ X_k \ V_k] \in \mathbb{R}^{2n \times 4k}, \quad Y_k, U_k, X_k, V_k \in \mathbb{R}^{2n \times k},
\]
with $J$-orthonormal columns has been constructed such that its columns span the same space as $K_{2k}(H, u_1) + K_{2k}(H^{-1}, H^{-1} u_1)$. The following three steps are repeated until the desired symplectic basis has been generated:

(3) Construct $u_{2k+1}$ and $v_{2k+1}$ and set
\[
    S_{2k+1} = [Y_k \ U_k \ u_{k+1} \ | \ X_k \ V_k \ v_{k+1}] = [Y_k \ U_{k+1} \ | \ X_k \ V_{k+1}] \in \mathbb{R}^{2n \times 4k+2},
\]
The Hamiltonian extended Krylov subspace method

with
\[ u_{k+1} = \begin{bmatrix} u_k & u_{k+1} \end{bmatrix}, \quad v_{k+1} = \begin{bmatrix} v_k & v_{k+1} \end{bmatrix} \in \mathbb{R}^{2n \times k+1}, \]
such that \( S_{2k+1}^T J_n S_{2k+1} = J_{2k+1} \) and \( \text{range}(S_{2k+1}) = K_{2k+2}(H, u_1) + K_{2k}(H^{-1}, H^{-1}u_1) \). The new vectors are added as the last column to the \( U \), resp. \( V \)-matrix.

4. Projection \( J_{r+s}^T S_{r+s}^T J_n H S_{r+s} \) of the Hamiltonian matrix \( H \). Assume that
\[ S_{r+s} = \begin{bmatrix} Y_s & U_r & X_s & V_r \end{bmatrix}, \quad Y_s, X_s \in \mathbb{R}^{2n \times s}, \quad U_r, V_r \in \mathbb{R}^{2n \times r}, \]
with \( J \)-orthogonal columns has been constructed with the HEKS algorithm (as before, we assume that \( r = s \) or \( r = s+1 \)). Then the projected Hamiltonian matrix
\[ H_{r+s} = J_{r+s}^T S_{r+s}^T J_n H S_{r+s} \in \mathbb{R}^{2(r+s) \times 2(r+s)}, \]
has a very special form with at most \( 2r + 8s \) nonzero entries. Let us first note that
\[ H_{r+s} = \begin{bmatrix} -X_s^T J_n H Y_s & -X_s^T J_n H U_r & -X_s^T J_n H X_s & -X_s^T J_n H V_r \\ -V_r^T J_n H Y_s & -V_r^T J_n H U_r & -V_r^T J_n H X_s & -V_r^T J_n H V_r \\ Y_s^T J_n H Y_s & Y_s^T J_n H U_r & Y_s^T J_n H X_s & Y_s^T J_n H V_r \\ U_r^T J_n H Y_s & U_r^T J_n H U_r & U_r^T J_n H X_s & U_r^T J_n H V_r \end{bmatrix}, \]
where the blocks are of size either \( s \times s, r \times r, s \times r, \) or \( r \times s \). As will be proven in Appendix A, ten of these blocks are zero, three are diagonal (denoted by \( \Delta_s, \Theta_r, \Lambda_s \)), one symmetric tridiagonal (denoted by \( T_r \)) and two anti-bidiagonal (denoted by \( B_{sr} \)), i.e.,

\[ H_{r+s} = \begin{bmatrix} 0 & A_s & B_{sr} \\ 0 & B_{sr}^T & T_r \\ \Delta_s & 0 & 0 \\ 0 & \Theta_r & 0 \end{bmatrix}, \]

(4.3)
with

\[
\Delta_s = \text{diag}(\delta_s, \ldots, \delta_1) \in \mathbb{R}^{s \times s}, \\
\Theta_r = \text{diag}(\theta_1, \ldots, \theta_r) \in \mathbb{R}^{r \times r}, \\
\Lambda_s = \text{diag}(\lambda_s, \ldots, \lambda_1) \in \mathbb{R}^{s \times s},
\]

\[
T_r = \begin{bmatrix} \alpha_1 & \beta_2 \\
\beta_2 & \ddots & \ddots \\
\ddots & \ddots & \ddots \\
\beta_r & \ddots & \ddots & \alpha_r \end{bmatrix} \in \mathbb{R}^{r \times r},
\]

and either

\[
B_{r-1,r} = \begin{bmatrix} \gamma_{r-1} & \mu_r \\
\mu_{r-1} & \ddots \\
\ddots & \ddots \\
\gamma_1 & \mu_2 \end{bmatrix} \in \mathbb{R}^{r-1 \times r} \quad \text{if} \quad r = s + 1,
\]

or

\[
B_{rr} = \begin{bmatrix} \gamma_r \\
\mu_r \\
\ddots \\
\gamma_1 & \mu_2 \end{bmatrix} \in \mathbb{R}^{r \times r} \quad \text{if} \quad r = s.
\]

In particular, it holds for \( j = 1, \ldots, s \)

\[
\delta_j = y_j^T J_n H y_j, \quad \lambda_j = -x_j^T J_n H x_j,
\]

and for \( j = 1, \ldots, r \)

\[
\vartheta_j = u_j^T J_n H u_j, \quad \alpha_j = -v_j^T J_n H v_j, \quad \gamma_j = -x_j^T J_n H v_j,
\]

and for \( j = 2, \ldots, r \)

\[
\beta_j = -v_j^T J_n H v_{j-1}, \quad \mu_j = -x_{j-1}^T J_n H v_j.
\]

We summarize this in the following theorem.

**Theorem 4.1.** Let \( H \in \mathbb{R}^{2n \times 2n} \) be a Hamiltonian matrix. Let \( r + s = n \) and either \( r = s + 1 \) or \( r = s \). Then in case the procedure described in Section 3 does not break down for \( u_1 \in \mathbb{R}^{2n} \) with \( \|u_1\|_2 = 1 \) there exists a symplectic matrix \( S \in \mathbb{R}^{2n \times 2n} \) such that \( Se_{s+1} = u_1 \),

\[
\text{range}\{S\} = K_{2r}(H, u_1) + K_{2s}(H^{-1}, H^{-1} u_1),
\]

and

\[
S^{-1} HS = H_{r+s},
\]

with \( H_{r+s} = H_n \) as in (4.3).

**Proof.** A constructive proof is given in Section A.
Remark 4.2. In case the Hamiltonian matrix \( H \) can be written in the form \( H = JK \) with the symmetric matrix \( K \) and \( K \) is positive definite, all inner products of the form \( w^T JHw \) and \( w^T JH^{-1}w \) are negative, as \( w^T JHw = w^T JJKw = -w^T Kw < 0 \) and as with \( K \) its inverse is symmetric and positive definite. Thus, in this case, all \( \delta_j \) and \( \vartheta_j \) are negative, while all \( \lambda_j \) and \( \alpha_j \) are positive. Such Hamiltonian matrices have been considered in [1, 2].

Theorem 4.1 implies

\[
H \begin{bmatrix} Y_k & U_k & X_k & V_k \end{bmatrix} = S \begin{bmatrix} 0 & 0 & \Lambda_k & B_{kk} \\ 0 & 0 & -B_{kk}^T & T_k \\ 0 & 0 & \mu_{k+1}e_1^T & \beta_{k+1}e_k^T \\ 0 & 0 & 0 & 0 \end{bmatrix}.
\]

From this, we obtain the HEKS recursion for \( r = s = k \)

\[ HS_{2k} = S_{2k}H_{2k} + \mu_{k+1}u_{k+1}e_{2k+1}^T + \beta_{k+1}u_{k+1}e_{k+1}^T, \]

while for \( r = s + 1 = k + 1 \) we have

\[ HS_{2k+1} = S_{2k+1}H_{2k+1} + (\gamma_{k+1}y_{k+1} + \beta_{k+2}u_{k+2})e_{k+2}^T. \]

5. Projection \( J_{r+s}^T S_{r+s} J_{r+s} H^{-1} S_{r+s} \) of the Hamiltonian matrix \( H^{-1} \). Assume that Theorem 4.1 holds. As \( H_n = S^{-1} HS \in \mathbb{R}^{2n \times 2n} \) is Hamiltonian, its inverse \( H_n^{-1} = S^{-1} H^{-1} S \) is Hamiltonian as well. Not only \( H_n \) has a nice sparse structure (4.3), but also its inverse. From that we can derive the special forms of \( J_{2k}^T S_{2k} H^{-1} S_{2k} \) and \( J_{2k+1}^T S_{2k+1} H^{-1} S_{2k+1} \).

Let \( S = S_n \) be a Hamiltonian matrix of the form \( [Y_s, U_r, X_r, V_r] \in \mathbb{R}^{2n \times 2n} \), where \( Y_s, U_r, V_r \in \mathbb{R}^{2n \times s} \), \( U_r, V_r \in \mathbb{R}^{2n \times r} \), and either \( r = s \) or \( r = s + 1 \). Due to \( S_n^{-1} = J_n^T S_n J_n \), we have

\[
H_n^{-1} = \begin{bmatrix} -X_s^T J_n H^{-1} Y_s & -X_s^T J_n H^{-1} U_r & -X_s^T J_n H^{-1} X_s & -X_s^T J_n H^{-1} V_r \\ -Y_s^T J_n H^{-1} Y_s & -Y_s^T J_n H^{-1} U_r & -Y_s^T J_n H^{-1} X_s & -Y_s^T J_n H^{-1} V_r \\ Y_s^T J_n H^{-1} Y_s & Y_s^T J_n H^{-1} U_r & Y_s^T J_n H^{-1} X_s & Y_s^T J_n H^{-1} V_r \\ U_r^T J_n H^{-1} Y_s & U_r^T J_n H^{-1} U_r & U_r^T J_n H^{-1} X_s & U_r^T J_n H^{-1} V_r \end{bmatrix}
\]

\[
= \begin{bmatrix} 0 & 0 & \Delta_r & 0 \\ 0 & 0 & 0 & \Theta_r \\ E_s & G_{sr} & 0 & 0 \\ G_{sr}^T & F_r & 0 & 0 \end{bmatrix},
\]

with \( E_s \in \mathbb{R}^{s \times s} \), \( F_r \in \mathbb{R}^{r \times r} \), \( G_{sr} \in \mathbb{R}^{s \times r} \) such that

\[
\begin{bmatrix} \Lambda_s & B_{sr} \\ B_{sr}^T & T_r \end{bmatrix} \begin{bmatrix} E_s & G_{sr} \\ G_{sr}^T & F_r \end{bmatrix} = I,
\]

\[
\begin{bmatrix} \Lambda_r & B_r \\ B_r^T & T_r \end{bmatrix} \begin{bmatrix} E_r & G_{sr} \\ G_{sr}^T & F_r \end{bmatrix} = I.
\]
holds and $\Delta_s, \Theta_r, \Lambda_s, T_r, B_{sr}$ from (4.3). The matrices $E_s, F_r$ and $G_{sr}$ have a special structure like $\Lambda_s, T_r$ and $B_{sr}$. $F_r$ is diagonal, $G_{sr}$ anti-bidiagonal as $B_{sr}$ and $E_s$ is symmetric tridiagonal;

$$F_r = \text{diag}(f_{11}, f_{22}, \ldots, f_{rr}), \quad E_s = \begin{bmatrix} e_{ss} & e_{s-1,s} & \cdots & e_{12} \\ e_{s-1,s} & \ddots & \cdots & \vdots \\ \vdots & \cdots & \ddots & \vdots \\ e_{12} & \cdots & \cdots & e_{11} \end{bmatrix} = E_s^T,$$

and either

$$G_{r-1,r} = \begin{bmatrix} g_{r-1,r-1} & g_{r-1,r} \\ \cdots & g_{r-2,r-1} \\ & g_{22} & \cdots \\ & & & g_{11} & g_{12} \end{bmatrix} \in \mathbb{R}^{r-1 \times r} \quad \text{if} \quad r = s + 1,$$

or

$$G_{rr} = \begin{bmatrix} g_{rr} \\ \cdots & g_{r-1,r} \\ & g_{22} & \cdots \\ & & & g_{11} & g_{12} \end{bmatrix} \in \mathbb{R}^{r \times r} \quad \text{if} \quad r = s.$$

Next, the projected matrices $J_{2k}^T S_{2k}^T J_n H^{-1} S_{2k}$ and $J_{2k+1}^T S_{2k+1}^T J_n H^{-1} S_{2k+1}$ will be described. Let

$$\mathbf{e}_j = \begin{bmatrix} I_j \\ 0 \end{bmatrix} \in \mathbb{R}^{r \times j}, \quad \mathbf{g}_j = \begin{bmatrix} 0 \\ I_j \end{bmatrix} \in \mathbb{R}^{s \times \ell}, \quad \sum_{j} = \begin{bmatrix} \mathbf{g}_j \mathbf{e}_j \end{bmatrix} \in \mathbb{R}^{2n \times (\ell + j)},$$

for $j \leq r, \ell \leq s$. Thus, for $2k \leq n$ it holds

$$S_n \sum_{kk} = S_{2k} \in \mathbb{R}^{2n \times 4k} \quad \text{and} \quad S_n \sum_{k,k+1} = S_{2k+1} \in \mathbb{R}^{2n \times 4k+2},$$

as well as

$$S_n J_n \sum_{kk} = [-X_k \quad -V_k \quad Y_k \quad U_k] = S_{2k} J_{2k} \in \mathbb{R}^{2n \times 4k},$$

$$S_n J_n \sum_{k,k+1} = [-X_k \quad -V_{k+1} \quad Y_k \quad U_{k+1}] = S_{2k+1} J_{2k+1} \in \mathbb{R}^{2n \times 4k+2}.$$

Hence, we obtain

$$J_{2k}^T S_{2k}^T J_n H^{-1} S_{2k} = \sum_{kk}^T J_n^T S_n^T J_n H^{-1} S_n \sum_{kk} = \sum_{kk}^T H_n^{-1} \sum_{kk} = \sum_{kk}^T \begin{bmatrix} 0 & 0 & \Delta^{-1}_s & 0 \\ 0 & 0 & 0 & \Theta^{-1}_r \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ \tilde{\mathbf{g}}_k^T \Delta^{-1}_s \tilde{\mathbf{g}}_k & 0 & 0 & \tilde{\mathbf{g}}_k^T \Theta^{-1}_r \mathbf{e}_k \\ \tilde{\mathbf{g}}_k^T E_r \tilde{\mathbf{g}}_k & \tilde{\mathbf{g}}_k^T G_{sr} \mathbf{e}_k & 0 & 0 \\ \tilde{\mathbf{g}}_k^T G_{sr} \tilde{\mathbf{g}}_k & \tilde{\mathbf{g}}_k^T F_r \mathbf{e}_k & 0 & 0 \end{bmatrix},$$

(5.6)
The Hamiltonian extended Krylov subspace method

and

\begin{equation}
J_n^T S_{2k+1} J_n H^{-1} S_{2k+1} + \Sigma_{k,k+1}^T J_n^T S_n J_n H^{-1} S_n \Sigma_{k,k+1} = \begin{bmatrix} 0 & 0 & \Delta_k^{-1} & 0 \\ 0 & 0 & 0 & \Theta_k^{-1} \\ E_k & G_{k,k+1} & 0 & 0 \\ G_{k,k+1}^T F_{k+1} & 0 & 0 \end{bmatrix}.
\end{equation}

The HEKS recurrences for $H^{-1}$ are given by

\begin{equation}
H^{-1} S_{2k} = S_{2k} \left( J_n^T S_{2k} J_n H^{-1} S_{2k} \right) + (c_{2k,2k+1} x_{2k+1} + g_{2k,2k+1} v_{2k+1}) e_1^T,
\end{equation}

and

\begin{equation}
H^{-1} S_{2k+1} = S_{2k+1} \left( J_n^T S_{2k+1} J_n H^{-1} S_{2k+1} \right) + x_{2k+1} (c_{2k,2k+1} e_1^T + g_{2k+1,2k+1} e_{2k+1}^T).
\end{equation}

6. HEKS algorithm. The HEKS algorithm is summarized in Fig. 1. The algorithm as given assumes that no breakdown occurs. Clearly, any division by zero will result in a serious breakdown. As can be seen from (4.4), a lucky breakdown occurs in case $\mu_{k+1} = \beta_{k+1} = 0$ or $u_{k+1} = 0$, as range $\{S_{2k}\} = K_{2k}(H, u_1) + K_{2k}(H^{-1}, H^{-1} u_1)$ is $H$-invariant. Moreover, (4.5) shows that in case $\gamma_{k+1} = \beta_{k+2} = 0$, a lucky breakdown occurs, as range $\{S_{2k+1}\} = K_{2k+2}(H, u_1) + K_{2k}(H^{-1}, H^{-1} u_1)$ is $H$-invariant. Similarly, lucky breakdown can be read off of (5.8) and (5.9) resulting in an $H^{-1}$-invariant subspace.

In case the Hamiltonian matrix $H$ can be written in the form $H = JK$ with a symmetric positive definite matrix $K$, all inner products of the form $w^T J H w$ and $w^T J H^{-1} w$ are negative (see Remark 4.2). Hence, most scalars by which is divided in Algorithm 1 are nonzero and do not cause breakdown.

Implemented efficiently such that each matrix-vector product as well as each linear solve is computed only once, the algorithm requires (for adding 4 vectors) in the for-loop just $O(n)$ flops

- 4 matrix-vector multiplications with $H$,
- 3 linear solves with $H$ (efficiently implemented in the form $(JH)x = (Jb)$ making use of the symmetry of $JH$),
- 14 scalar products.

Any multiplication of a vector $w$ by $J_n$ should be implemented by rearranging the upper and the lower part of the vector $w$. That is, let $w = \begin{bmatrix} w_1 \\ w_2 \end{bmatrix}$, then $J_n w = \begin{bmatrix} w_1 \\ w_2 \\ \end{bmatrix}$.

Without some form of re-$J$-orthogonalization, the HEKS algorithm suffers from the same numerical difficulties as any other Krylov subspace method. For the application of approximating $f(H)v$ considered here, the full basis has to be stored. Thus, full re-$J$-orthogonalization is possible without any additional memory requirements. But this would add $O(nk^2)$ flops to the otherwise $O(nk)$ flop count in case $S_{2k}$ or $S_{2k+1}$ is computed. The computational efficiency due to the short term recurrence is lost in case $k$ is large. Hence, in that case, some form of periodic, partial, or selective re-$J$-orthogonalization in analogy to these procedures for the symmetric Lanczos method should be employed (see, e.g., [25, Chapter 3.1] and the references therein). In order to derive such a semi-$J$-orthogonal method, an error analysis of the HEKS method similar to that of [3] for the unsymmetric Lanczos method and [10] for the symplectic Lanczos method for the symplectic eigenproblem has to be derived. This is well beyond the scope of this paper.
Algorithm 1 HEKS with short recurrences.

Require: Hamiltonian matrix $H \in \mathbb{R}^{2n \times 2n}$, $u_1 \in \mathbb{R}^{2n}$ with $\|u_1\|_2 = 1$

Ensure: a) $S_{2k} = [y_k \cdots y_1 u_1 \cdots u_k | x_k \cdots x_1 v_1 \cdots v_k] \in \mathbb{R}^{2n \times 4k}$ with $S_{2k}^T J_n S_{2k} = J_{2k}$ and $H_{2k} = J_{2k} S_{2k}^T J_n H S_{2k}$ as in (4.3)

b) parameters $\gamma_j, \delta_j, \alpha_j, \gamma_j, \delta_j$ for $j = 1, \ldots, k$ and $\beta_j, \mu_j$ for $j = 2, \ldots, k$ which determine $H_{2k}$ (for $S_{2k+1} \in \mathbb{R}^{2n \times 4k+2}$ the algorithm needs to be modified appropriately)

1: $u_1 = u_1/\|u_1\|_2$ \hspace{1cm} $\triangleright$ Set up $S_1 = [u_1 | v_1]$
2: $v_1 = H u_1/\|u_1\|_2$ \hspace{1cm} $\triangleright$ Set up $S_2 = [y_1 u_1 | x_1 v_1]$
3: $v_{1i} = H u_{1i}/\|u_{1i}\|_2$
4: $f_{11} = u_1^T J_n H^{-1} u_1$
5: $w_x = H^{-1} u_1 - f_{11} v_1$
6: $x_1 = w_x/\|w_x\|_2$
7: $y_1 = H^{-1} x_1 x_1^T J_n H^{-1} x_1$
8: $\lambda_1 = -x_1^T J_n H x_1$ and $\delta_1 = y_1^T J_n H y_1$
9: $\alpha_1 = -v_1^T J_n H v_1$ and $\gamma_1 = -x_1^T J_n H v_1$ \hspace{1cm} $\triangleright$ Set up $S_3 = [y_1 u_1 w_2 | x_1 v_1 v_2]$
10: $w_u = H v_1 - \gamma_1 y_1 - \alpha_1 u_1$
11: $u_2 = w_u/\|w_u\|_2$
12: $\vartheta_2 = u_2^T J_n H u_2$
13: $v_2 = H u_2/\vartheta_2$
14: $e_{11} = y_1^T J_n H^{-1} y_1$
15: $g_{11} = y_1^T J_n H^{-1} u_1$, and $g_{12} = y_1^T J_n H^{-1} u_2$
16: $w_x = H^{-1} y_1 - e_{11} x_1 - g_{11} v_1 - g_{12} v_2$
17: $x_2 = w_x/\|w_x\|_2$
18: $y_2 = H^{-1} x_2/(H^{-1} x_2)^T J_n x_2$
19: $\lambda_2 = -x_2^T J_n H x_2$ and $\delta_2 = y_2^T J_n H y_2$

for $j = 3, 4, \ldots, k$ do
21: $\alpha_{j-1} = -v_{j-1}^T J_n H v_{j-1}$ and $\beta_{j-1} = -v_{j-1}^T J_n H v_{j-2}$ \hspace{1cm} $\triangleright$ Set up $S_{2j-1}$
22: $\gamma_{j-1} = -x_{j-1}^T J_n H v_{j-1}$ and $\mu_{j-1} = -x_{j-1}^T J_n H v_{j-1}$
23: $u_j = H u_{j-1} - \gamma_{j-1} y_{j-1} - \mu_{j-1} y_{j-2} - \beta_{j-1} u_{j-2} - \alpha_{j-1} u_{j-1}$
24: $u_j = u_j/\|u_j\|_2$
25: $\vartheta_j = u_j^T J_n H u_j$
26: $v_j = H u_j/\vartheta_j$
27: $g_{j-1,j-1} = y_{j-1}^T J_n H^{-1} u_{j-1}$ and $g_{j-1,j} = y_{j-1}^T J_n H^{-1} u_{j-2}$ \hspace{1cm} $\triangleright$ Set up $S_{2j}$
28: $e_{j-1,j-1} = y_{j-1}^T J_n H^{-1} y_{j-1}$ and $e_{j-2,j-1} = y_{j-1}^T J_n H^{-1} y_{j-2}$
29: $w_x = H^{-1} y_{j-1} - e_{j-1,j-1} x_{j-1} - e_{j-2,j-1} x_{j-2} - g_{j-1,j-1} v_{j-1} - g_{j-1,j} v_{j-2}$
30: $x_j = w_x/\|w_x\|_2$
31: $y_j = H^{-1} x_j/(H^{-1} x_j)^T J_n x_j$
32: $\lambda_j = -x_j^T J_n H x_j$ and $\delta_j = y_j^T J_n H y_j$

end for

34: $\alpha_k = -v_k^T J_n H v_k$ and $\beta_k = -v_k^T J_n H v_{k-1}$
35: $\gamma_k = -x_k^T J_n H v_k$ and $\mu_k = -x_k^T J_n H v_{k-1}$

7. Numerical experiments. In this section, we demonstrate experimentally that the HEKS algorithm may be useful for approximating $f(H)u$ for a (large-scale) Hamiltonian matrix $H \in \mathbb{R}^{2n \times 2n}$ and a vector $u \in \mathbb{R}^{2n}, \|u\|_2 = 1$, via
The Hamiltonian extended Krylov subspace method

(7.10) \[ f(H)u \approx \tilde{S}f(\tilde{H})J_n^T \tilde{S}^T J_n u, \]

with the \(2n \times 2\ell\) \(J\)-orthogonal matrix \(\tilde{S}\) and the \(2\ell \times 2\ell\) Hamiltonian matrix \(\tilde{H} = J_n^T \tilde{S}^T J_n \tilde{H} \tilde{S}\). We consider two methods (both based on a short term recurrence) to construct \(\tilde{S}\):

- the HEKS method (Algorithm 1) which generates a \(J\)-orthogonal matrix \(\tilde{S}\) such that \(\text{range}(\tilde{S}) = \mathcal{K}_{r,s}\) with \(r = s = \frac{\ell}{2}\) or \(r - 1 = s = \frac{\ell-1}{2}\), depending on whether \(\ell\) is even or odd. Then \(f(H)u\) can be approximated via \(\tilde{S}f(\tilde{H})e_{s+1}\) (as due to the construction \(J_n^T \tilde{S}^T J_n u = e_{s+1}\)),

- the Hamiltonian Lanczos method (HamL) \([5, 4, 26]\) which generates a \(J\)-orthogonal matrix \(\tilde{S}\) such that \(\text{range}(\tilde{S}) = \mathcal{K}_{2\ell}(H, u)\). Then, \(f(H)u\) can be approximated via \(\tilde{S}f(\tilde{H})e_1\) (as due to the construction \(J_n^T \tilde{S}^T J_n u = e_1\)).

The Hamiltonian Lanczos method requires slightly less flops than the HEKS method. The comments on re-\(J\)-orthogonalization stated at the end of Section 6 also apply to the Hamiltonian Lanczos method. These methods are compared to the corresponding unstructured methods

- the extended Krylov subspace method (EKSM) \([18]\),
- the standard Arnoldi method \([12]\),

which generate an orthogonal matrix \(Q\) such that either \(\text{range}(Q) = \mathcal{K}_{r,s}\) or \(\text{range}(Q) = \mathcal{K}_{2\ell}(H, u)\). Then \(f(H)u\) can be approximated via \(Qf(Q^T HQ)e_1\) (as by construction, \(Q^T u = e_1\) holds).

Only functions \(f\) which map \(H\) to a structured matrix are dealt with. In particular, we consider

- \(f(H) = \exp(H)\) : the exponential function of a Hamiltonian matrix is a symplectic matrix \([14]\),
- \(f(H) = \cos(H) : \cos(H)\) is a skew-Hamiltonian matrix (as a sum of even powers of \(H\)),
- \(f(H) = \text{sign}(H) : \text{sign}(H)\) is a Hamiltonian matrix \([21]\). The matrix sign function is defined for any matrix \(X \in \mathbb{C}^{n \times n}\) having no pure imaginary eigenvalues by \(\text{sign}(X) = X(X^2)^{-\frac{1}{2}}\) \([16, 17]\). An equivalent definition is \(\text{sign}(X) = T \text{diag}(-I_p, I_q) T^{-1}\), where the Jordan decomposition of \(X = T \text{diag}(J_1, J_2) T^{-1}\) is such that the \(p\) eigenvalues of \(J_1\) are assumed to lie in the open left half-plane, while the \(q\) eigenvalues of \(J_2\) lie in the open right half-plane. The Newton iteration \(S_0 = X, S_{k+1} = \frac{1}{2} (X_k + X_k^{-1})\) converges quadratically to \(\text{sign}(X)\) \([24]\).

Utilizing HEKS or HamL, the projected matrix \(\tilde{H}\) is Hamiltonian again, so that \(f(\tilde{H})\) has the same structure as \(f(H)\), while the projected matrix \(Q^T HQ\) as well as \(f(Q^T HQ)\) obtained via EKSM and Arnoldi have no particular structure. Such a structure-preserving approximation of \(f(H)u\) is, e.g., important in the context of symplectic exponential integrators for Hamiltonian systems, see, e.g., \([9, 13, 22, 23]\). Another example is the solution of second order differential equations \(\frac{d^2 y}{dt^2} + H^2 y = 0, y(0) = y_0, y'(0) = y_0'\), which is given by \(y(t) = \cos(Ht)y_0 + H^{-1} \sin(Ht)y_0'\). A further example is the computation of \(\text{sign}(H)c\) for given vectors \(c\) in the context of the overlap-Dirac operator in lattice quantum chromodynamics (QCD). Usually, this task is formulated considering \(\text{sign}(Q)c\) for a complex Hermitian matrix \(Q\), see, e.g., \([17, \text{Chapter 2.7}]\) and \([7]\), but it can easily be reformulated in terms of the Hamiltonian matrix \(H = JQ\).

All experiments are performed in MATLAB R2021b on an Intel(R) Core(TM) i7-8565U CPU @ 1.80GHz 1.99 GHz with 16GB RAM. Our MATLAB implementation employs the standard MATLAB function \texttt{expm} and \texttt{funm(H,@cos)} as well as \texttt{signm} from the Matrix Computation Toolbox \([15]\). The experimental code used to generate the results presented in the following subsection can be found at \([11]\). All algorithms are run to yield a \(1000 \times 30\) matrix whose columns span the corresponding (extended) Krylov subspace. All methods are implemented using full re-\((J)\)-orthogonalization. (Please note that full re-\((J)\)-orthogonalization
may not be needed when the dimension $2k$ of the basis to be computed is low. Alternatively, a semi-
(J)-orthogonal method can be employed. Here, full re-(J)-orthogonalization is employed in order to be
able to show the full power of using a symplectic basis versus an orthogonal one for approximating $f(H)v$
without having to argue about loss of (J)-orthogonality. The accuracy of the approximation for HEKS and
HamL is measured in terms of the relative error $\|f(H)u - \tilde{S}f(\tilde{H})J_2^T\tilde{S}^TJ_nu\|_2/\|f(H)u\|_2$, while $\|f(H)u - Qf(Q^T HQ)Q^T u\|_2/\|f(H)u\|_2$ is used for EKSM and Arnoldi.

7.1. Example 1. Inspired by [18, Example 4.1], our first test matrix is a diagonal Hamiltonian matrix $H_1 = \text{diag}(D, -D)$ with a diagonal $500 \times 500$ real matrix $D$ whose eigenvalues are log-uniformly distributed in the interval $[10^{-1}, 1]$. EKSM will preserve the symmetry of $H$, while HEKS and HL will not.

In Fig. 1, the relative accuracy of all four methods is displayed, using a random starting vector $x$ (plots in the two leftmost columns) as well as a starting vector of all ones (plots in the two rightmost columns). The Hamiltonian Lanczos method and the Arnoldi method perform alike just as the HEKS algorithm and the EKS method. For the functions exp and cos, the HEKS approximation makes significant progress only every other iteration step (that is, whenever the columns of $\tilde{S}$ span $K_{k, k-1}$). The same holds for the EKSM approximation of $\cos(H)x$ and $\cos(H)e$, but not for the approximation of $\exp(H)x$ and $\exp(H)e$. The HEKS algorithm adds the vectors from $K_{r,s}$ in a different order than EKSM: HEKS alternates between adding two vectors from $K_{2k}(H, u)$ and adding two vectors from $K_{2k}(H^{-1}, H^{-1}u)$, while EKSM alternates between adding one vector from $K_{2k}(H, u)$ and adding one from $K_{2k}(H^{-1}, H^{-1}u)$ (for $u = x$ or $u = e$). Thus, the columns of $\tilde{S}$ and $Q$ span the same subspace only every other step. Adding vectors from $K_{2k}(H^{-1}, H^{-1}u)$ does not seem to be relevant for the HEKS approximations $\exp(H)u$ and $\cos(H)u$ as well for the EKSM approximation of $\cos(H)u$. For the EKSM approximation of $\exp(H)u$, some convergence progress can be observed in every iteration step, but the overall convergence is similar to that of the HEKS approximation. In summary, the use of an extended Krylov subspace does not improve the convergence for these examples compared to the approximations computed using the Arnoldi method or the Hamiltonian Lanczos method. The latter two methods converge about twice as fast as the first two.

But for the matrix sign function, the two methods based on the extended Krylov subspace converge faster than the other two. They do make progress in every iteration step. It is clearly beneficial to use an extended Krylov subspace here.

The HEKS algorithm requires 34 matrix-vector multiplications with $H$, 21 linear solves with $H$ and 104 scalar products to construct the $1000 \times 30$ matrix $\tilde{S}$. In contrast, the ESKM requires 15 matrix-vector multiplications with $H$, 14 linear solves with $H$ and 493 scalar products. As $H$ in this example is diagonal, the linear solves and matrix-vector multiplications require less arithmetic operations than scalar products. Hence, the HEKS algorithm is faster than EKSM and requires less storage. Of course, the situation will change for more practically relevant examples with a more complex sparsity pattern. But it remains to note that there is a big difference in the number of scalar products to be performed, which is not due to the matrix structure but the difference of the short-term Lanczos-style and long-term Arnoldi-style recursions in the nonsymmetric case.

7.2. Example 2. As a second example, we use the Hamiltonian matrix $H_2 = \begin{bmatrix} A & -G \\ -Q & -A^T \end{bmatrix} \in \mathbb{R}^{1998 \times 1998}$ from Example 15 of the collection of benchmark examples for the numerical solution of continuous-time algebraic Riccati equations [6]. The matrix has a complex spectrum with real and imaginary parts between $-2$ and $2$. 

P. Benner et al. 582
The Hamiltonian extended Krylov subspace method

Fig. 1. Diagonal Hamiltonian matrix $H_1 = \text{diag}(A, -A)$ with $A = \text{diag}(\logspace(-1, 0, 500))$; two different choices of the starting vector $z = \text{rand}(1000, 1)$ and $e = \text{ones}(1000, 1)$.

Fig. 2 provides the same information as in Fig. 1. Our findings from the first example are confirmed. The Hamiltonian Lanczos method and the Arnoldi method perform alike just as the HEKS algorithm and the EKS method. For the functions $\exp$ and $\cos$, the first two methods converge faster than the latter two. The use of the extended Krylov subspace does not result in faster convergence. But for the matrix sign function, the two method based on the extended Krylov subspace perform much better.
8. Concluding remarks. The HEKS algorithm for computing a $J$-orthogonal basis of the extended Krylov subspace $K_{r,s}$ (1.1) has been presented. Unlike the EKSM for generating an orthogonal basis of $K_{r,r}$ it allows for short recurrences. The convergence analysis provide in [18] does not apply here as the field of values of a Hamiltonian matrix does not (strictly) lie in the right half-plane. Numerical experiments suggest that it may be useful to employ the HEKS algorithm for the approximation of the action of $f(H)$ on a vector.
u for Hamiltonian matrices H. The performance of the HEKS algorithm is similar to that of EKSM, but HEKS guarantees the structure-preserving projection of the Hamiltonian matrix which may be relevant for some applications.

Appendix A. Derivation of the HEKS algorithm. This section is devoted to deriving short recurrences for the HEKS algorithm. We will follow the idea sketched in Section 3. First $S_1 \in \mathbb{R}^{2n\times 2}$ is constructed such that $S_1^T J_n S_1 = J_1$ and the columns of $S_1$ span the same subspace as $\mathcal{K}_2(H, u_1)$ (that is, range$\{S_1\} = \mathcal{K}_2(H, u_1)$). Here, $H \in \mathbb{R}^{2n\times 2n}$ is the Hamiltonian matrix under consideration and $u_1 \in \mathbb{R}^{2n}$ a given vector with $\|u_1\|_2 = 1$. Next $S_{2k} \in \mathbb{R}^{2n\times 4k}$ is constructed by extending $S_{2k-1}$ by two columns such that $S_{2k}^T J_n S_{2k} = J_{2k}$ and range$\{S_{2k}\} = \mathcal{K}_{2k}(H, u_1) + \mathcal{K}_{2k}(H^{-1}, H^{-1}u_1)$. Finally, $S_{2k+1} \in \mathbb{R}^{2n\times 4k+2}$ is constructed by extending $S_{2k}$ by two columns such that $S_{2k+1}^T J_n S_{2k+1} = J_{2k+1}$ and range$\{S_{2k+1}\} = \mathcal{K}_{2k+1}(H, u_1) + \mathcal{K}_{2k+1}(H^{-1}, H^{-1}u_1)$. In doing so, we will provide a proof that the projected matrices $H_{2k}$ and $H_{2(k+1)}$ as well as $J_{2k}^T S_{2k}^T J_n H^{-1} S_{2k}$ and $J_{2(k+1)}^T S_{2(k+1)}^T J_n H^{-1} S_{2(k+1)}$ are of the above given forms (4.3), (5.6) and (5.7), respectively. In particular, we will prove Theorem 4.1. The assumption in Theorem 4.1 that no breakdown occurs in particular implies that in the following all assumptions on nonzero parameters must hold.

A.1. Step 1: range$\{S_1\} = \mathcal{K}_2(H, u_1)$. As $u_1$ satisfies $\|u_1\|_2 = 1$, there is nothing to do with the first vector in $\mathcal{K}_2(H, u_1)$. The second vector $H u_1$ needs to $J$-orthogonalized against $u_1$. This is achieved by

$$v_1 = H u_1 / u_1^T J_n H u_1 = H u_1 / \vartheta_1,$$

assuming that $\vartheta_1 = u_1^T J_n H u_1 \neq 0$. Thus, the matrix $S_1 = [u_1 \mid v_1]$ has $J$-orthogonal columns by construction

$$S_1^T J_n S_1 = \begin{bmatrix} u_1^T J_n u_1 & u_1^T J_n v_1 \\ v_1^T J_n u_1 & v_1^T J_n v_1 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix},$$

as any vector is $J$-orthogonal to itself, $u_1^T J_n v_1 = u_1^T J_n H u_1 / u_1^T J_n H u_1 = 1$ and $v_1^T J_n u_1 = (u_1^T J_n^T v_1)^T = -(u_1^T J_n v_1)^T$.

A.1.1. The projected matrix $H_1 = J_1^T S_1^T J_n H S_1$. We will prove that

$$H_1 = J_1^T S_1^T J_n H S_1 = \begin{bmatrix} v_1^T J_n H u_1 & -v_1^T J_n H v_1 \\ u_1^T J_n H u_1 & u_1^T J_n H v_1 \end{bmatrix} = \begin{bmatrix} 0 & \alpha_1 \\ 0 & 0 \end{bmatrix},$$

holds. Due to (A.11) we have $H u_1 = \vartheta_1 v_1$ and thus

$$v_1^T J_n H u_1 = \vartheta_1 \cdot v_1^T J_n v_1 = 0,$$

as any vector is $J$-orthogonal to itself. The zero in position (2,2) follows from the zero in position (1,1) as $H$ as well as $H_1$ is Hamiltonian (or by noting that $0 = v_1^T J_n H u_1 = (u_1^T J_n H^T u_1)^T = u_1^T (J_n H)^T v_1 = u_1^T J_n H v_1 = 0$).

A.1.2. The projected matrix $J_1^T S_1^T J_n H^{-1} S_1$. Making use of the fact that $H^T J_n H^{-1} = -J_n$ as $H$ is Hamiltonian ($(J_n H)^T = -H^T J_n = J_n H$), we have due to (A.11)

$$\vartheta_1 \cdot v_1^T J_n H^{-1} u_1 = (H u_1)^T J_n H^{-1} u_1 = u_1^T H^T J_n H^{-1} u_1 = -u_1^T J_n u_1 = 0.$$

This implies \( u_1^T J_n H^{-1} u_1 = 0 \). Moreover, using (A.11) again
\[
v_1^T J_n H^{-1} v_1 = (H u_1)^T J_n H^{-1} (H u_1) / \vartheta_1^2 = u_1^T H^T J_n u_1 / \vartheta_1^2 = -u_1^T J_n H u_1 / \vartheta_1^2 = -1 / \vartheta_1.
\]
Thus
\[
J_1^T S_1^T J_n H^{-1} S_1 = \begin{bmatrix}
-v_1^T J_n H^{-1} u_1 & -v_1^T J_n H^{-1} v_1 \\
u_1^T J_n H^{-1} u_1 & u_1^T J_n H^{-1} v_1
\end{bmatrix} = \begin{bmatrix} 0 & 1 / \vartheta_1 \\ f_{11} & 0 \end{bmatrix}.
\]

**A.2. Step 2:** \( \text{range}\{S_2\} = K_2(H, u_1) + K_2(H^{-1}, H^{-1} u_1) \). Now the first vector from the Krylov subspace \( K_r(H^{-1}, H^{-1} u_1) \) is added to the symplectic basis by \( J\)-orthogonalization \( H^{-1} u_1 \) against \( u_1 \) and \( v_1 \). This is achieved by computing
\[
w_x = (I - S_1 J_1^T S_1^T J_n) H^{-1} u_1,
\]
and normalizing \( w_x \) to length 1, \( x_1 = w_x / \|w_x\|_2 \). Next the second vector from \( K_r(H^{-1}, H^{-1} u_1) \) needs to be added to the symplectic basis. This can be accomplished by \( J\)-orthogonalizing \( H^{-1} x_1 \) against \( u_1 \) and \( v_1 \)
\[
w_y = (I - S_1 J_1^T S_1^T J_n) H^{-1} x_1,
\]
and making sure that \( w_y \) is \( J\)-orthogonal against \( x_1 \) as well, \( y_1 = w_y / w_y^T J x_1 \). Here, we assume that \( \|w_x\|_2 \neq 0 \) as well as \( w_y^T J x_1 \neq 0 \).

Collect the vectors into a matrix \( S_2 = [y_1 | x_1 | v_1] \in \mathbb{R}^{2n \times 4} \). By construction the columns of \( S_2 \) are \( J\)-orthogonal, that is
\[
S_2^T J_n S_2 = J_2,
\]
and
\[
\text{range}\{S_2\} = K_2(H, u_1) + K_2(H^{-1}, H^{-1} u_1).
\]

Let us take a closer look at \( w_x \) and \( w_y \). Making use of (A.13), we have
\[
w_x = H^{-1} u_1 - [v_1 - u_1] \begin{bmatrix} u_1^T J_n H^{-1} u_1 \\ v_1^T J_n H^{-1} u_1 \end{bmatrix} = H^{-1} u_1 - [v_1 - u_1] \begin{bmatrix} f_{11} \\ 0 \end{bmatrix} = H^{-1} u_1 - f_{11} v_1.
\]
Hence, with \( \psi_1 = \|w_x\|_2 \) we have
\[
x_1 = \left( H^{-1} u_1 - f_{11} v_1 \right) / \psi_1,
\]
where, as already stated above, \( \psi_1 \neq 0 \) is assumed.

Next we turn our attention to \( w_y \). We will make use of the fact that \( H^{-1} \) is Hamiltonian \( (J_n H^{-1} = -H^{-T} J_n) \) and \( S_2^T J_n S_2 = J_2 \). With (A.15) we see
\[
u_1^T J_n H^{-1} x_1 = -(H^{-1} u_1)^T J_n x_1 = -(\psi_1 x_1 + f_{11} v_1)^T J_n x_1 = 0.
\]
Similarly, it follows with (A.11) that
\[
v_1^T J_n H^{-1} x_1 = -(H^{-1} v_1)^T J_n x_1 = u_1^T J_n x_1 / \vartheta_1 = 0.
\]
The Hamiltonian extended Krylov subspace method

Hence,

\[ w_y = H^{-1}x_1 - [v_1 - u_1] \begin{bmatrix} u_1^T J_n H^{-1} x_1 \\ v_1^T J_n H^{-1} x_1 \end{bmatrix} = H^{-1}x_1 - [v_1 - u_1] \begin{bmatrix} 0 \\ 0 \end{bmatrix} = H^{-1}x_1, \]

and

\[ y_1 = H^{-1}x_1/\xi_1, \]

where we assume that

\[ \xi_1 = (H^{-1}x_1)^T J_n x_1 = x_1^T H^{-T} J_n x_1 \neq 0. \]

Observe that

\[ \delta_1 = y_1^T J_n H y_1 = \frac{1}{\xi_1^2} x_1^T H^{-T} J_n H H^{-1} x_1 = \frac{1}{\xi_1^2} x_1^T H^{-T} J_n x_1 = \frac{1}{\xi_1}. \]

Thus

\[ y_1 = H^{-1}x_1/\xi_1 = \delta_1 H^{-1}x_1. \]

**A.2.1. The projected matrix** \( H_2 = J_2^T S_2^T J_n H S_2 \). We will see that the zero structure of \( H_2 = J_2^T S_2^T J_n H S_2 \) is given as follows:

\[
H_2 = \begin{bmatrix}
-x_1^T J_n H y_1 & -x_1^T J_n H u_1 \\
-v_1^T J_n H y_1 & -v_1^T J_n H u_1 \\
y_1^T J_n H y_1 & y_1^T J_n H u_1 \\
u_1^T J_n H y_1 & u_1^T J_n H u_1
\end{bmatrix} = \begin{bmatrix}
0 & 0 & \lambda_1 & \gamma_1 \\
0 & 0 & \gamma_1 & \alpha_3 \\
\delta_1 & 0 & 0 & 0 \\
0 & \delta_1 & 0 & 0
\end{bmatrix}.
\]

The entries at the positions (2, 2), (4, 2), (2, 4), and (4, 4) (denoted in blue in (A.21)) are the same as in (A.12). Due to \( H \) and thus \( H_2 \) being Hamiltonian, we only need to prove the zero entries at the positions (1, 1), (1, 2), (2, 1), and (3, 2), the other zeros in (A.21) follow immediately.

Due to (A.11) we have \( H u_1 = \vartheta_1 v_1 \). Thus, \( x_1^T J_n H u_1 = \vartheta_1 \cdot x_1^T J_n v_1 = 0 \) and \( y_1^T J_n H u_1 = \vartheta_1 \cdot y_1^T J_n v_1 = 0 \) due to (A.14). This gives the zero entries in the positions (1, 2) and (3, 2).

Due to (A.20) it follows with (A.14) for the entry (2, 1)

\[ v_1^T J_n H y_1 = \delta_1 v_1^T J_n H x_1 = \delta_1 v_1^T J_n x_1 = 0. \]

Moreover, in a similar way for the entry (1, 1), we have

\[ x_1^T J_n H y_1 = \delta_1 x_1^T J_n H x_1 = \delta_1 x_1^T J_n x_1 = 0. \]

Hence, (A.21) holds.
A.2.2. The projected matrix $J_2^T S_2^T J_n H^{-1} S_2$. Some of the entries in $\tilde{H}_2 = J_2^T S_2^T J_n H^{-1} S_2$ (denoted in blue) are already known from (A.13),

$$
\tilde{H}_2 = \begin{bmatrix}
-x^T J_n H^{-1} y_1 & -x^T J_n H^{-1} u_1 \\
-v_1^T J_n H^{-1} y_1 & -v_1^T J_n H^{-1} u_1 \\
y_1^T J_n H^{-1} y_1 & y_1^T J_n H^{-1} u_1 \\
u_1^T J_n H^{-1} y_1 & u_1^T J_n H^{-1} u_1
\end{bmatrix} = \begin{bmatrix}
-x^T J_n H^{-1} x_1 & -x^T J_n H^{-1} v_1 \\
-v_1^T J_n H^{-1} x_1 & -v_1^T J_n H^{-1} v_1 \\
y_1^T J_n H^{-1} x_1 & y_1^T J_n H^{-1} v_1 \\
u_1^T J_n H^{-1} x_1 & u_1^T J_n H^{-1} v_1
\end{bmatrix}
$$

(A.22)

The entry in position (1, 3) follows from (A.18) and (A.19), while the zero entries in the positions (1, 2), (1, 4), (2, 3), and (4, 3) have already been proven in (A.16) and (A.17).

It remains to consider the entries at the positions (3, 3) and (3, 4). Using (A.20) and (A.11) leads to

$$
y_1^T J_n H^{-1} x_1 = \delta_1 (H^{-1} x_1)^T J_n (H^{-1} x_1) = 0,
y_1^T J_n H^{-1} v_1 = y_1^T J_n u_1 / \vartheta_1 = 0.
$$

Hence, (A.22) holds.

A.3. Step 3: range($S_2$) = $\mathcal{K}_4(H, u_1) + \mathcal{K}_2(H^{-1}, H^{-1} u_1)$. In this step, the next two vectors $H^2 u_1$ and $H^3 u_1$ from $\mathcal{K}_4(H, u_1)$ are added to the symplectic basis. We start by $J$-orthogonalizing $Hv_1$ against the columns of $S_2$

$$
w_u = (I - S_2 J_2^T S_2^T J_n) H v_1 = H v_1 - \begin{bmatrix}
y_1^T J_n H v_1 \\
u_1^T J_n H v_1 \\
x_1^T J_n H v_1 \\
v_1^T J_n H v_1
\end{bmatrix}
= H v_1 - \begin{bmatrix}
x_1 & v_1 & -y_1 & -u_1
\end{bmatrix}
\begin{bmatrix}
0 \\
0 \\
-\gamma_1 \\
-\alpha_1
\end{bmatrix} = H v_1 - \gamma_1 y_1 - \alpha_1 u_1,
$$

(A.23)

where (A.21) gives that the first two entries of the last vector are zero. Normalizing $w_u$ to length 1 gives $u_2$

$$
u_2 = w_u / \chi_2,
$$

(A.24)

where it is assumed that $\chi_2 = \|w_u\|_2 \neq 0$.

This step is finalized by $J$-orthogonalizing $H u_2$ against the columns of $S_2$:

$$
w_v = (I - S_2 J_2^T S_2^T J_n) H u_2 = H u_2 - \begin{bmatrix}
y_1^T J_n H u_2 \\
u_1^T J_n H u_2 \\
x_1^T J_n H u_2 \\
v_1^T J_n H u_2
\end{bmatrix}
= w_v / \chi_2,
$$
The Hamiltonian extended Krylov subspace method

All entries of the last vector are zero. The first two zeros follow as $H^{-T}J_nH = -J_n$ with (A.20) and (A.11):

$$
\begin{align*}
y_1^T J_n H u_2 / \delta_1 &= (H^{-1} x_1)^T J_n H u_2 = -x_1^T J_n u_2 = 0, \\
u_1^T J_n H u_2 / \vartheta_1 &= (H^{-1} v_1)^T J_n H u_2 = -v_1^T J_n u_2 = 0
\end{align*}
$$

by construction of $u_2$. The last zero follows as $H$ is Hamiltonian with (A.23),

$$
v_1^T J_n H u_2 = v_1^T (J_n H)^T u_2 = -(H v_1)^T J_n u_2 = -(\chi_2 u_2 + \gamma_1 y_1 + \alpha_1 u_1) ^T J_n u_2 = 0
$$

again due to the construction of $u_2$. With this and (A.15), we have for the next to last entry

$$
\psi_1 \cdot x_1^T J_n H u_2 = (H^{-1} u_1 + f_{11} v_1)^T J_n H u_2 = -u_1^T J_n u_2 + f_{11} v_1^T J_n H u_2 = 0.
$$

Thus, the expression for $w_v$ simplifies to

$$w_v = H u_2.$$

Normalizing $w_v$ by $\vartheta_2 = u_2^T J_n H u_2$ to make sure it is $J$-orthogonal to $u_2$ as well yields

$$v_2 = H u_2 / \vartheta_2.$$

Let

$$S_3 = [y_1, u_1, u_2, v_1, v_2] \in \mathbb{R}^{2n \times 6}.$$  

Then by construction

$$S_3^T J_n S_3 = J_3,$$

and

$$\text{range}\{S_3\} = K_4(H, u_1) + K_2(H^{-1}, H^{-1} u_1).$$

**A.3.1. The projected matrix $H_3$**

$H_3 = J_3^T S_3^T J_n H S_3$. Some of the entries (denoted in blue) in $H_3 = J_3^T S_3^T J_n H S_3$ are already known from (A.21)

$$H_3 = \begin{bmatrix}
0 & 0 & -x_1^T J_n H u_2 & \lambda_1 & \gamma_1 & -x_1^T J_n H v_2 \\
0 & 0 & -v_1^T J_n H u_2 & \gamma_1 & \alpha_1 & -v_1^T J_n H v_2 \\
-v_2^T J_n H y_1 & -v_2^T J_n H u_1 & -v_2^T J_n H v_1 & -v_2^T J_n H x_1 & -v_2^T J_n H v_2 \\
\delta_1 & 0 & y_1^T J_n H u_2 & 0 & 0 & y_1^T J_n H v_2 \\
u_2^T J_n H y_1 & u_2^T J_n H u_1 & u_2^T J_n H v_1 & u_2^T J_n H x_1 & u_2^T J_n H v_2 & 0
\end{bmatrix}
$$

$$= \begin{bmatrix}
0 & 0 & 0 & \lambda_1 & \gamma_1 & \mu_2 \\
0 & 0 & 0 & \gamma_1 & \alpha_1 & \beta_2 \\
0 & 0 & 0 & \mu_2 & \beta_2 & \alpha_2 \\
\delta_1 & 0 & 0 & 0 & 0 & 0 \\
0 & \vartheta_1 & 0 & 0 & 0 & 0 \\
0 & 0 & \vartheta_2 & 0 & 0 & 0
\end{bmatrix}.
$$

(A.26)

The zeros in the third column (and hence the zeros in the last row) follow with $H u_2 = \vartheta_2 v_2$ due to (A.25). Moreover, we have with (A.20) and (A.11)

$$v_2^T J_n H y_1 = \delta_1 v_2^T J_n x_1 = 0,$$

$$v_2^T J_n H u_1 = \vartheta_1 v_2^T J_n v_1 = 0,$$

making again use of (A.25). Hence, (A.26) holds.
A.3.2. The projected matrix $J^T S_3^T J_n H^{-1} S_3$. Some of the entries in $\tilde{H}_3 = J^T S_3^T J_n H^{-1} S_3$ (denoted in blue) are already known from (A.22)

$$
\begin{align*}
\tilde{H}_3 &= \begin{bmatrix}
0 & 0 & -x^T_1 J_n H^{-1} u_2 & 1/\vartheta_1 & 0 & -x^T_2 J_n H^{-1} v_2 \\
0 & 0 & -x^T_2 J_n H^{-1} u_2 & 0 & 1/\vartheta_1 & -v^T_2 J_n H^{-1} v_2 \\
-v^T_2 J_n H^{-1} y_1 & -v^T_2 J_n H^{-1} u_1 & -v^T_2 J_n H^{-1} u_2 & 0 & 0 & -v^T_2 J_n H^{-1} v_1 \\
v^T_1 J_n H^{-1} u_1 & v^T_1 J_n H^{-1} u_2 & v^T_2 J_n H^{-1} u_2 & 0 & 0 & v^T_2 J_n H^{-1} v_2 \\
u^T_1 J_n H^{-1} y_1 & u^T_2 J_n H^{-1} u_1 & u^T_2 J_n H^{-1} u_2 & 0 & 0 & u^T_2 J_n H^{-1} v_2 \\
0 & 0 & 0 & 1/\vartheta_1 & 0 & 0 \\
0 & 0 & 0 & 0 & 1/\vartheta_2 & 0 \\
0 & 0 & 0 & 0 & 0 & 1/\vartheta_2 \\
0 & 0 & 0 & 0 & 0 & 0 \\
\end{bmatrix}.
\end{align*}
$$

(A.27)

It remains to show that the five entries $v^T_2 J_n H^{-1} z$ for $z = x_1, v_1, y_1, u_1, u_2$ as well as the three entries $z^T J_n H^{-1} u_2$ for $z = v_1, x_1, u_1$ are zero. Moreover, we need to show that $-v^T_2 J_n H^{-1} v_2 = 1/\vartheta_2$.

Most of these relations follow from $H^T J_n H^{-T} = -J_n$ and due to $H u_j = \vartheta_j v_j$, $j = 1, 2$. Making use of (A.25) in the last equality of each equation, we have

$$
\begin{align*}
\vartheta_1 v_1^T J_n H^{-1} u_2 &= u_1^T H^T J_n H^{-1} u_2 = -u_1^T J_n u_2 = 0, \\
\vartheta_2 v_2^T J_n H^{-1} u_2 &= u_2^T H^T J_n H^{-1} u_2 = -u_2^T J_n u_2 = 0,
\end{align*}
$$

and for $z = x_1, v_1, y_1, u_1, u_2$

$$
\begin{align*}
\vartheta_2 v_2^T J_n H^{-1} z &= u_2^T H^T J_n H^{-1} z = -u_2^T J_n z = 0.
\end{align*}
$$

Thus, $-v^T_2 J_n H^{-1} v_2 = 1/\vartheta_2$ and the five entries in the $(1, 1)$ (and the $(2, 2)$) block of $\tilde{H}_3$ are zero.

The derivation of the final two zero entries needs a slightly more involved derivation. Due to (A.24), (A.25), and (A.22) we have

$$
\begin{align*}
\chi_2 x_1^T J_n H^{-1} u_2 &= x_1^T J_n H^{-1} (H v_1 - \gamma_1 y_1 - \alpha_1 u_1) \\
&= x_1^T J_n v_1 - \gamma_1 x_1^T J_n H^{-1} y_1 - \alpha_1 x_1^T J_n H^{-1} u_1 = 0,
\end{align*}
$$

while due to $H^{-1}$ being Hamiltonian, (A.15) and (A.25) we get

$$
\begin{align*}
u_1^T J_n H^{-1} u_2 &= (H^{-1} u_1)^T J_n u_2 = (\psi_1 x_1 + f_1 v_1)^T J_n u_2 = 0.
\end{align*}
$$

Hence, (A.27) holds.

A.4. Step 4: range$\{S_4\} = K_4(H, u_1) + K_4(H^{-1}, H^{-1} u_1)$. In this step, the next two vectors $H^{-1} u_1$ and $H^{-1} u_1$ from $K_4(H^{-1}, H^{-1} u_1)$ are added to the symplectic basis. We start by $J$-orthogonalizing $H^{-1} y_1$
against the columns of $S_3$

$$w_x = (I - S_3 J_3^T S_3^T J_n) H^{-1} y_1 = H^{-1} y_1 - [x_1 V_2 | -y_1 - U_2] V_3 J_n H^{-1} y_1$$

$$= H^{-1} y_1 - [x_1 V_2 | -y_1 - U_2] \begin{bmatrix} e_{11} \\ g_{11} \\ g_{12} \\ 0 \\ 0 \\ 0 \end{bmatrix} = H^{-1} y_1 - e_{11} x_1 - g_{11} v_1 - g_{12} v_2,$$

due to (A.27).

Normalizing $w_x$ to length 1 gives

$$(A.28) \quad x_2 = w_x / \psi_2,$$

where we assume that $\psi_2 = \|w_x\|_2 \neq 0$.

This step is finalized by $J$-orthogonalizing $H^{-1} x_2$ against the columns of $S_3$

$$(A.29) \quad w_y = (I - S_3 J_3^T S_3^T J_n) H^{-1} x_2 = H^{-1} x_2 - [x_1 V_2 | -y_1 - U_2] V_3 J_n H^{-1} x_2.$$ 

All entries $z^T J_n H^{-1} x_2 = -(H^{-1} z)^T J_n x_2$ in the last vector are zero. As $H u_i = \vartheta_i v_i$, $i = 1, 2$, for the last two entries, we have

$$\vartheta_1 \cdot (H^{-1} v_1)^T J_n x_2 = u_1^T J_n x_2 = 0, \quad \vartheta_2 \cdot (H^{-1} v_2)^T J_n x_2 = u_2^T J_n x_2 = 0,$$

by construction of $x_2$ as a vector $J$-orthogonal to all columns of $S_3$. Next, we use (A.28), (A.20), and (A.15) to see

$$(H^{-1} y_1)^T J_n x_2 = (\psi_2 x_2 - e_{11} x_1 - g_{11} v_1 - g_{12} v_2)^T J_n x_2 = 0,$$

$$(H^{-1} x_1)^T J_n x_2 = \xi_1 y_1^T J_n x_2 = 0,$$

$$(H^{-1} u_1)^T J_n x_2 = (\psi_1 x_1 - f_{11} v_1)^T J_n x_2 = 0,$$

again by construction of $x_2$ as a vector $J$-orthogonal to all columns of $S_3$. With this and (A.24), it follows that

$$\chi_2 \cdot (H^{-1} u_2)^T J_n x_2 = (v_1 - \gamma_1 H^{-1} y_1 - \alpha_1 H^{-1} u_1)^T J_n x_2 = 0.$$

Thus,

$$y_2 = H^{-1} x_2 / \xi_2,$$
where we assume that

(A.30) \[ \xi_2 = (H^{-1}x_2)^T J_n x_2 = x_2^T H^{-T} J_n x_2 \neq 0. \]

With the same argument as in (A.19), we see that

\[ \delta_2 = y_2^T J_n H y_2 = \frac{1}{\xi_2} (H^{-1}x_2)^T J_n H \frac{1}{\xi_2}. \]

Thus

(A.31) \[ y_2 = H^{-1}x_2 / \xi_2 = \delta_2 H^{-1}x_2. \]

Let

\[ S_4 = \begin{bmatrix} y_2 & y_1 & u_1 & u_2 \end{bmatrix} H_y \begin{bmatrix} x_2 & v_2 \end{bmatrix} \in \mathbb{R}^{2n \times 8}. \]

Then by construction

(A.32) \[ S_4^T J_n S_4 = J_4, \]

and

\[ \text{range}(S_4) = \mathcal{K}_4(H, u_1) + \mathcal{K}_4(H^{-1}, H^{-1} u_1). \]

A.4.1. The projected matrix \( H_4 = J_4^T S_4^T J_n H S_4 \). Some of the entries in

\[ H_4 = J_4^T S_4^T J_n H S_4 = \begin{bmatrix} H_4^{(11)} & H_4^{(12)} \\ H_4^{(21)} & H_4^{(22)} \end{bmatrix}, \]

with

\[ H_4^{(11)} = \begin{bmatrix} -x_2^T J_n H y_2 & -x_2^T J_n H y_1 & -x_2^T J_n H u_1 & -x_2^T J_n H u_2 \\ -x_1^T J_n H y_2 & 0 & 0 & 0 \\ -v_1^T J_n H y_2 & 0 & 0 & 0 \\ -v_2^T J_n H y_2 & 0 & 0 & 0 \end{bmatrix}, \]

\[ H_4^{(12)} = \begin{bmatrix} -x_2^T J_n H x_2 & -x_2^T J_n H x_1 & -x_2^T J_n H v_1 & -x_2^T J_n H v_2 \\ -x_1^T J_n H x_2 & \lambda_1 & \gamma_1 & \mu_2 \\ -v_1^T J_n H x_2 & \alpha_1 & \beta_2 & \alpha_2 \\ -v_2^T J_n H x_2 & \mu_2 & \beta_2 & \alpha_2 \end{bmatrix}, \]

\[ H_4^{(21)} = \begin{bmatrix} y_2^T J_n H y_2 & y_2^T J_n H y_1 & y_2^T J_n H u_1 & y_2^T J_n H u_2 \\ y_1^T J_n H y_2 & \delta_1 & 0 & 0 \\ u_1^T J_n H y_2 & 0 & \vartheta_1 & 0 \\ u_2^T J_n H y_2 & 0 & 0 & \vartheta_2 \end{bmatrix}, \]

\[ H_4^{(22)} = \begin{bmatrix} y_2^T J_n H x_2 & y_2^T J_n H x_1 & y_2^T J_n H v_1 & y_2^T J_n H v_2 \\ y_1^T J_n H x_2 & \gamma_1 & \alpha_1 & \beta_2 \\ u_1^T J_n H x_2 & 0 & \vartheta_1 & 0 \\ u_2^T J_n H x_2 & 0 & 0 & \vartheta_2 \end{bmatrix}, \]

are already known from (A.26) (denoted in blue).
We will show that

\[
H_4 = \begin{bmatrix}
0 & 0 & 0 & 0 & \lambda_2 & 0 & 0 & \gamma_2 \\
0 & 0 & 0 & 0 & \lambda_1 & \gamma_1 & \mu_2 \\
0 & 0 & 0 & 0 & \gamma_1 & \alpha_1 & \beta_2 \\
0 & 0 & 0 & 0 & \mu_2 & \beta_2 & \alpha_2 \\
0 & \delta_2 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \delta_1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & \delta_3 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0
\end{bmatrix}.
\]

(A.33)

Let us consider the entries in the first column of (A.33). We make use of (A.31) and obtain

\[
z^T J_n H y_2 = \delta_2 z^T J_n x_2.
\]

For \( z = x_1, x_2, v_1, y_1, u_1, u_2 \) we have \( z^T J_n x_2 = 0 \) due to (A.32), while, \( y_2^T J_n x_2 = 1 \). Thus \( y_2^T J_n y_2 = \delta_2 \). Moreover, the other 7 entries in the first column are zero. This implies that the other 7 entries in the fifth row are zero as well.

For the entries \( x_2^T J_n H z \) for \( z = y_1, u_1, u_2 \), in the first row we note that

\[
\psi_2 \cdot x_2^T J_n H z = (H^{-1} y_1 - e_1 u_1 - f_1 v_1) = 0,
\]

due to (A.32). Hence, (A.33) holds.

### A.4.2. The projected matrix \( J_4^T S_4^T J_4 H^{-1} S_4 \)

Some of the entries in

\[
\tilde{H}_4 = J_4^T S_4^T J_4 H^{-1} S_4 = \begin{bmatrix}
\tilde{H}_4^{(11)} & \tilde{H}_4^{(12)} \\
\tilde{H}_4^{(21)} & \tilde{H}_4^{(22)}
\end{bmatrix},
\]
with

\[
\tilde{H}^{(11)}_4 = \begin{bmatrix}
-x^T J_n H^{-1} y_2 & 0 & 0 & 0 \\
-x^T J_n H^{-1} y_2 & 0 & 0 & 0 \\
v^T J_n H^{-1} y_2 & 0 & 0 & 0 \\
v^T J_n H^{-1} y_2 & 0 & 0 & 0 \\
\end{bmatrix},
\]

\[
\tilde{H}^{(12)}_4 = \begin{bmatrix}
-x^T J_n H^{-1} x_2 & 0 & 0 & 0 \\
0 & 1/\delta_1 & 0 & 0 \\
0 & 0 & 1/\vartheta_1 & 0 \\
0 & 0 & 0 & 1/\vartheta_2 \\
\end{bmatrix},
\]

\[
\tilde{H}^{(21)}_4 = \begin{bmatrix}
y_2^T J_n H^{-1} y_2 & y_2^T J_n H^{-1} y_1 & y_2^T J_n H^{-1} u_1 \\
y_1^T J_n H^{-1} y_2 & e_{11} & g_{11} & g_{12} \\
u_1^T J_n H^{-1} y_2 & g_{11} & f_{11} & 0 \\
u_2^T J_n H^{-1} y_2 & g_{12} & 0 & f_{22} \\
\end{bmatrix},
\]

\[
\tilde{H}^{(22)}_4 = \begin{bmatrix}
y_2^T J_n H^{-1} x_2 & y_2^T J_n H^{-1} x_1 & y_2^T J_n H^{-1} v_1 & y_2^T J_n H^{-1} v_2 \\
y_2^T J_n H^{-1} x_2 & 0 & 0 & 0 \\
y_2^T J_n H^{-1} x_2 & 0 & 0 & 0 \\
y_2^T J_n H^{-1} x_2 & 0 & 0 & 0 \\
\end{bmatrix}
\]

are already known from (A.27) (denoted in blue). In addition, most of the entries in the first column of \(\tilde{H}^{(12)}_4\) and \(\tilde{H}^{(22)}_4\) and hence in the first row of \(\tilde{H}^{(11)}_4\) and \(\tilde{H}^{(12)}_4\) are known from the derivations concerning (A.29) (denoted in red).

Next we will show that

\[
\tilde{H}_4 = \begin{bmatrix}
0 & 0 & 0 & 0 & 1/\delta_2 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1/\delta_1 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 1/\vartheta_1 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 1/\vartheta_2 \\
e_{12} & e_{11} & g_{12} & g_{22} & 0 & 0 & 0 & 0 \\
e_{12} & e_{11} & g_{12} & g_{22} & 0 & 0 & 0 & 0 \\
g_{12} & g_{11} & f_{11} & 0 & 0 & 0 & 0 & 0 \\
g_{22} & g_{12} & 0 & f_{22} & 0 & 0 & 0 & 0 \\
\end{bmatrix}
\]

Let us consider the remaining entries in the first row of \(\tilde{H}_4\). As \(H^{-1}\) is Hamiltonian and due to (A.30), we have

\[
x_2^T J_n H^{-1} x_2 = x_2^T (J_n H^{-1})^T x_2 = -(H^{-1} x_2)^T J_n x_2 = -\xi_2 = -1/\delta_2.
\]

Due to (A.31) and (A.32), it follows that

\[
\xi_2 \cdot y_2^T J_n H^{-1} x_2 = y_2^T J_n y_2 = 0.
\]

Finally, we consider the three remaining entries in the first column,

\[
z^T J_n H^{-1} y_2 = -(H^{-1} z)^T J_n y_2,
\]
The computational steps can be found in Algorithm 1. For $z = x_1, v_1, v_2$. Due to $\partial_i H^{-1}v_i = u_i$ for $i = 1, 2$, we obtain with (A.32)

$$\delta_1 \cdot (H^{-1}v_1)^T J_n y_2 = u_i^T J_n y_2 = 0,$$

while with (A.20) we have

$$\delta_1 \cdot (H^{-1}x_1)^T J_n y_2 = y_1^T J_n y_2 = 0.$$

Hence, (A.34) holds.

**A.5. Step 5:** range$\{S_6\} = \mathcal{K}_6(H, u_1) + \mathcal{K}_4(H^{-1}, H^{-1}u_1)$ and **Step 6:** range$\{S_6\} = \mathcal{K}_6(H, u_1) + \mathcal{K}_6(H^{-1}, H^{-1}u_1)$. We refrain from stating Steps 5 and 6 explicitly even so $u_2$ and $x_2$ are not displaying the general form of $u_k$ and $x_k$. This can only be seen from $u_3$ and $x_3$ which would be derived in Steps 5 and 6. As the derivations which lead to $u_3$ and $x_3$ are the same as in the general case for deriving $u_{k+1}$ and $x_{k+1}$, we directly proceed to the general case assuming that Algorithm 1 holds up to step $k$.

**A.6. Step 2k+1:** range$\{S_{2k+1}\} = \mathcal{K}_{2k+2}(H, u_1) + \mathcal{K}_{2k}(H^{-1}, H^{-1}u_1)$. Assume that we have constructed

$$S_{2k} = [y_k \cdots y_1 \ u_k \ | \ x_k \ \cdots \ x_1 \ v_1 \ \cdots \ v_k] = [Y_k \ U_k | X_k \ V_k] \in \mathbb{R}^{2n \times 4k}$$

such that $S_{2k}^T J_n S_{2k} = J_{2k}$,

$$H_{2k} = J_{2k}^T S_{2k}^T J_n H S_{2k} = \begin{bmatrix} -X_k^T J_n H Y_k & -X_k^T J_n H U_k & -X_k^T J_n H X_k & -X_k^T J_n H V_k \\ -V_k^T J_n H Y_k & -V_k^T J_n H U_k & -V_k^T J_n H X_k & -V_k^T J_n H V_k \\ Y_k^T J_n H Y_k & Y_k^T J_n H U_k & Y_k^T J_n H X_k & Y_k^T J_n H V_k \\ U_k^T J_n H Y_k & U_k^T J_n H U_k & U_k^T J_n H X_k & U_k^T J_n H V_k \end{bmatrix}$$

(A.35)

as in (4.3) ($r = s = k$),

$$\bar{H}_{2k} = J_{2k}^T S_{2k}^T J_n H^{-1} S_{2k} = \begin{bmatrix} -X_k^T J_n H^{-1} Y_k & -X_k^T J_n H^{-1} U_k & -X_k^T J_n H^{-1} X_k & -X_k^T J_n H^{-1} V_k \\ -V_k^T J_n H^{-1} Y_k & -V_k^T J_n H^{-1} U_k & -V_k^T J_n H^{-1} X_k & -V_k^T J_n H^{-1} V_k \\ Y_k^T J_n H^{-1} Y_k & Y_k^T J_n H^{-1} U_k & Y_k^T J_n H^{-1} X_k & Y_k^T J_n H^{-1} V_k \\ U_k^T J_n H^{-1} Y_k & U_k^T J_n H^{-1} U_k & U_k^T J_n H^{-1} X_k & U_k^T J_n H^{-1} V_k \end{bmatrix}$$

(A.36)

as in (5.6) and

$$\text{range} \{S_{2k}\} = \mathcal{K}_{2k}(H, u_1) + \mathcal{K}_{2k}(H^{-1}, H^{-1}u_1).$$

The computational steps can be found in Algorithm 1.
In this step, the next two vectors $H^{2k}u_1$ and $H^{2k+1}u_1$ from $\mathcal{K}_{2k+2}(H, u_1)$ are added to the symplectic basis. Due to the previous construction, this is achieved by first considering $Hv_k$. $J$-orthogonalizing $Hv_k$ against the columns of $S_{2k}$ yields

$$w_u = (I - S_{2k}J_{2k}^T S_{2k}^T J_n) H v_k = H v_k - [X_k \ V_k \ -Y_k \ -U_k] \begin{bmatrix} Y_k^T J_n H v_k \\ U_k^T J_n H v_k \\ X_k^T J_n H v_k \\ V_k^T J_n H v_k \end{bmatrix}$$

$$= H v_k - \gamma_k y_k - \mu_k y_{k-1} - \beta_k u_{k-1} - \alpha_k u_k,$$

as due to (A.35)

$$Y_k^T J_n H v_k = 0, \quad U_k^T J_n H v_k = 0,$$

$$X_k^T J_n H v_k = \begin{bmatrix} -\gamma_k \\ -\mu_k \\ 0 \\ \vdots \\ 0 \end{bmatrix}, \quad V_k^T J_n H v_k = \begin{bmatrix} 0 \\ \vdots \\ 0 \\ -\beta_k \\ -\alpha_k \end{bmatrix}.$$

Normalizing $w_u$ to length 1 gives

(A.37)$$u_{k+1} = w_u / \chi_{k+1},$$

where it is assumed that $\chi_{k+1} = \|w_u\|_2 \neq 0$.

This step is finalized by $J$-orthogonalizing $H u_{k+1}$ against the columns of $S_{2k}$

$$w_v = (I - S_{2k}J_{2k}^T S_{2k}^T J_n) H u_{k+1} = H u_{k+1} - [X_k \ V_k \ -Y_k \ -U_k] \begin{bmatrix} Y_k^T J_n H u_{k+1} \\ U_k^T J_n H u_{k+1} \\ X_k^T J_n H u_{k+1} \\ V_k^T J_n H u_{k+1} \end{bmatrix}.$$

All entries of the last vector are zero. The zeros in the first two blocks $Y_k^T J_n H u_{k+1}$ and $U_k^T J_n H u_{k+1}$ can be seen by using $y_j = \delta_j H^{-1}x_j$ and $u_j = \vartheta_j H^{-1}v_j$ for $j = 1, \ldots, k$ as well as $H^{-1}J_n H = -J_n$:

$$y_j^T J_n H u_{k+1} / \delta_j = (H^{-1}x_j)^T J_n H u_{k+1} = -x_j^T J_n u_{k+1} = 0,$$

$$u_j^T J_n H u_{k+1} / \vartheta_j = (H^{-1}v_j)^T J_n H u_{k+1} = -v_j^T J_n u_{k+1} = 0,$$

due to the construction of $u_{k+1}$ as $J$-orthogonal against all columns of $S_{2k}$.

The zeros in the last block $V_k^T J_n H v_k$ follow as $H$ is Hamiltonian and with

$$\chi_j u_j = Hv_j - \gamma_j y_j - \mu_j y_{j-1} - \beta_j u_{j-1} - \alpha_j u_j,$$

for $j = 1, \ldots, k$, (where we set $\beta_1 = \mu_1 = 0$ and $y_0 = u_0 = 0$)

$$v_j^T J_n H u_{k+1} = v_j^T (J_n H)^T u_{k+1} = -(Hv_j)^T J_n u_{k+1}$$

(A.38)$$= - (\chi_j u_j + \gamma_j y_j + \mu_j y_{j-1} + \beta_j u_{j-1} + \alpha_j u_j)^T J_n u_{k+1} = 0,$$

again due to the construction of $u_{k+1}$ as $J$-orthogonal against all columns of $S_{2k}$. 
The Hamiltonian extended Krylov subspace method

With this we can show that the entries of the next to last block $X_n^T J_n H \psi_k$ are all zero. First, with $\psi_1 x_1 = H^{-1} u_1 - f_{11} v_1$ and $H^{-T} J_n H = -J_n$ we have

$$
\psi_1 \cdot x_1^T J_n H u_{k+1} = (H^{-1} u_1 - f_{11} v_1)^T J_n H u_{k+1} = u_1^T H^{-T} J_n H u_{k+1} - f_{11} v_1^T J_n H u_{k+1}
$$

$$
= -u_1^T J_n u_{k+1} - f_{11} v_1^T J_n H u_{k+1} = 0,
$$

(A.39)
due to the construction of $u_{k+1}$ as $J$-orthogonal against all columns of $S_{2k}$ and due to (A.38). Next, we use

$$
\psi_{j+1} x_{j+1} = H^{-1} y_j - e_{jj} x_j - e_{j-1,j} x_{j-1} - g_{jj} v_j - g_{j1,j+1} v_{j+1},
$$

(A.40)
for $j = 1, \ldots, k - 1$ (where we set $e_{01} = 0$ and $x_0 = 0$, see Lines 16 and 29 of Algorithm 1) for the other entries of the next to last block

$$
\psi_{j+1} \cdot x_{j+1}^T J_n H u_{k+1} = -(e_{jj} x_j + e_{j-1,j} x_{j-1} + g_{jj} v_j + g_{j1,j+1} v_{j+1})^T J_n H u_{k+1} + y_j^T H^{-T} J_n H u_{k+1}
$$

$$
= -(e_{jj} x_j + e_{j-1,j} x_{j-1})^T J_n H u_{k+1} - y_j^T J_n u_{k+1},
$$

as $v_j^T J_n H u_{k+1} = 0$ due to (A.38). Clearly, $y_j^T J_n u_{k+1} = 0$ by construction of $u_{k+1}$. Thus, it remains to consider

$$
\psi_{j+1} \cdot x_{j+1}^T J_n H u_{k+1} = -(e_{jj} x_j + e_{j-1,j} x_{j-1})^T J_n H u_{k+1}.
$$

For $j = 1$ we have with $x_0 = 0$ and (A.39) that $\psi_2 \cdot x_2^T J_n H u_{k+1} = 0$. With this, we get $\psi_j \cdot x_j^T J_n H u_{k+1} = 0$, and, continuing in this fashion,

$$
\psi_{j+1} \cdot x_{j+1}^T J_n H u_{k+1} = 0.
$$

Thus, the expression for $w_v$ simplifies to

$$
w_v = H u_{k+1}.
$$

Normalizing $w_v$ by $\vartheta_{k+1} = u_{k+1}^T J_n H u_{k+1}$ to make sure it is $J$-orthogonal to $u_{k+1}$ yields

$$
u_{k+1} = H u_{k+1} / \vartheta_{k+1}.
$$

(A.41)

Let $S_{2k+1} = [y_k \cdots y_1 \ u_1 \cdots u_{k+1} \mid x_k \cdots x_1 \ v_1 \cdots v_{k+1}] = [Y_k \ U_{k+1} \mid X_k \ V_{k+1}] \in \mathbb{R}^{2n \times 4k+2}$. Then by construction

$$
S_{2k+1}^T H_n S_{2k+1} = J_{2k+1},
$$

(A.42)
and range{$S_{2k+1}$} = $\mathcal{K}_{2k+2}(H, u_1) + \mathcal{K}_{2k}(H^{-1}, H^{-1} u_1)$.

A.6.1. The projected matrix $H_{2k+1} = J_{2k+1}^T S_{2k+1}^T H_n S_{2k+1}$. Most of the entries in

$$
H_{2k+1} = J_{2k+1}^T S_{2k+1}^T H_n S_{2k+1} H_{2k+1} = \begin{bmatrix}
H^{(11)}_{2k+1} & H^{(12)}_{2k+1} \\
H^{(21)}_{2k+1} & H^{(22)}_{2k+1}
\end{bmatrix},
$$

where
with

\[
H^{(11)}_{2k+1} = \begin{bmatrix}
0 & 0 & -X_k^T J_n H u_{k+1} \\
0 & 0 & -V_k^T J_n H u_{k+1} \\
-v_{k+1}^T J_n H Y_k & -v_{k+1}^T J_n H U_k & -v_{k+1}^T J_n H u_{k+1}
\end{bmatrix},
\]

\[
H^{(12)}_{2k+1} = \begin{bmatrix}
\Lambda_k & B_{kk} & -X_k^T J_n H v_{k+1} \\
B_{kk}^T & T_k & -V_k^T J_n H v_{k+1} \\
-v_{k+1}^T J_n H X_k & -v_{k+1}^T J_n H V_k & -v_{k+1}^T J_n H v_{k+1}
\end{bmatrix},
\]

\[
H^{(21)}_{2k+1} = \begin{bmatrix}
\Delta_k & 0 & Y_k^T J_n H u_{k+1} \\
0 & \Theta_k & U_k^T J_n H u_{k+1} \\
u_{k+1}^T J_n H Y_k & u_{k+1}^T J_n H U_k & u_{k+1}^T J_n H u_{k+1}
\end{bmatrix},
\]

\[
H^{(22)}_{2k+1} = \begin{bmatrix}
\Delta_k & 0 & Y_k^T J_n H v_{k+1} \\
0 & \Theta_k & U_k^T J_n H v_{k+1} \\
u_{k+1}^T J_n H X_k & u_{k+1}^T J_n H V_k & u_{k+1}^T J_n H v_{k+1}
\end{bmatrix}
\]

are already known from \(H_{2k}\) (A.35) (denoted in blue).

Next we will show that

\[
H_{2k+1} = \begin{bmatrix}
0 & 0 & 0 & \Lambda_k & B_{kk} & \mu_k & 0 & \cdots \\
0 & 0 & 0 & B_{kk}^T & T_k & 0 & \cdots & 0 & \beta_{k+1} & \alpha_{k+1} \\
0 & 0 & 0 & \mu_k & 0 & 0 & \cdots & 0 & \beta_{k+1} & \alpha_{k+1} \\
\Delta_k & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \Theta_k & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \vartheta_{k+1} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\Delta_k & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\Delta_k & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \Theta_{k+1} & 0 & 0 & 0 & 0 & 0 & 0 & 0
\end{bmatrix}
\]

(A.43)

The zeros in the third column (and hence in the last row) follow due to \(H u_{k+1} = \vartheta_{k+1} v_{k+1}\) and (A.42). The zeros in the first block \(v_{k+1}^T J_n H Y_k\) of the third row follow due to \(H y_j = \delta_j x_j\), for \(j = 1, \ldots, k\), the ones in the second block \(v_{k+1}^T J_n H U_k\) due to \(H u_j = \vartheta_j v_j\), \(j = 1, \ldots, k\). This also implies the zeros in the last row of the fourth and fifth block.

Moreover, we obtain

\[
v_{k+1}^T J_n H V_{k-1} = 0,
\]

from

\[
\chi_{j+1} u_{j+1} = H v_j - \gamma_j y_j - \mu_j y_{j-1} - \beta_j u_{j-1} - \alpha_j u_j,
\]

for \(j = 1, \ldots, k-1\) (where we set \(\beta_0 = \mu_0 = 0\) and \(u_0 = y_0 = 0\), see Lines 11 and 24 in Algorithm 1) as

\[
v_{k+1}^T J_n H v_j = v_{k+1}^T J_n (\psi_{j+1} u_{j+1} + \gamma_j y_j + \mu_j y_{j-1} + \beta_j u_{j-1} + \alpha_j u_j) = 0,
\]
due to the construction of $v_{k+1}$ as $J$-orthogonal against all columns of $S_{2k}$. With this, $\psi_1 x_1 = H^{-1} u_1 - f_{11} v_1$ and the recurrence for $x_j$ as in (A.40), we observe that

$$v_{k+1}^T J_n X_{k-1} = 0,$$

holds. This can be seen step by step. Due to (A.42) and $v_{k+1}^T J_n V_{k-1} = 0$, we have

$$\psi_1 v_{k+1}^T J_n H x_1 = v_{k+1}^T J_n H (H^{-1} u_1 - f_{11} v_1) = v_{k+1}^T J_n u_1 - f_{11} v_{k+1}^T J_n v_1 = 0,$$

and with this and (A.28) we have further

$$\psi_2 v_{k+1}^T J_n H x_2 = -v_{k+1}^T J_n y_1 - e_{11} v_{k+1}^T J_n H x_1 - g_{11} v_{k+1}^T J_n H v_1 - g_{12} v_{k+1}^T J_n H v_2 = 0.$$

In this fashion, we continue with the expression for $x_{j+1}$ as in Line 30 of Algorithm 1 to obtain for $j = 2, \ldots, k - 2$

$$\psi_{j+1} v_{k+1}^T J_n H x_{j+1} = -v_{k+1}^T J_n y_j - e_{11} v_{k+1}^T J_n H x_j - e_{j-1,j} v_{k+1}^T J_n H x_{j-1} - g_{jj} v_{k+1}^T J_n H v_j + g_{j+1,j} v_{k+1}^T J_n H v_{j+1} = 0.$$

Hence, (A.43) holds.

**A.6.2. The projected matrix $J_{2k+1}^T S_{2k+1}^T J_n H^{-1} S_{2k+1}$.** Most of the entries in

$$\tilde{H}_{2k+1} = J_{2k+1}^T S_{2k+1}^T J_n H^{-1} S_{2k+1} = \begin{bmatrix} \tilde{H}_{2k+1}^{(11)} & \tilde{H}_{2k+1}^{(12)} \\ \tilde{H}_{2k+1}^{(21)} & \tilde{H}_{2k+1}^{(22)} \end{bmatrix},$$

with

$$\tilde{H}_{2k+1}^{(11)} = \begin{bmatrix} 0 & 0 & -X_k^T J_n H^{-1} u_{k+1} \\ 0 & 0 & -V_k^T J_n H^{-1} u_{k+1} \\ -v_{k+1}^T J_n H^{-1} y_k & -v_{k+1}^T J_n H^{-1} u_k & -v_{k+1}^T J_n H^{-1} u_{k+1} \end{bmatrix},$$

$$\tilde{H}_{2k+1}^{(12)} = \begin{bmatrix} \Delta_k^{-1} & 0 & -X_k^T J_n H^{-1} v_k \\ 0 & \Theta_k^{-1} & -V_k^T J_n H^{-1} v_k \\ -v_{k+1}^T J_n H^{-1} x_k & -v_{k+1}^T J_n H^{-1} y_{k+1} & -v_{k+1}^T J_n H^{-1} y_{k+1} \end{bmatrix},$$

$$\tilde{H}_{2k+1}^{(21)} = \begin{bmatrix} E_k & G_k & Y_k^T J_n H^{-1} u_{k+1} \\ G_k^T & F_k & U_k^T J_n H^{-1} u_{k+1} \\ u_{k+1}^T J_n H^{-1} y_k & u_{k+1}^T J_n H^{-1} u_k & u_{k+1}^T J_n H^{-1} u_{k+1} \end{bmatrix},$$

$$\tilde{H}_{2k+1}^{(22)} = \begin{bmatrix} 0 & 0 & Y_k^T J_n H^{-1} v_{k+1} \\ 0 & 0 & U_k^T J_n H^{-1} v_{k+1} \\ u_{k+1}^T J_n H^{-1} x_k & u_{k+1}^T J_n H^{-1} y_{k+1} & u_{k+1}^T J_n H^{-1} y_{k+1} \end{bmatrix},$$

are already known from (A.36) (denoted in blue).
Next we show that

\[
\tilde{H}_{2k+1} = \begin{bmatrix}
\Delta_k^{-1} & 0 & 0
0 & \Theta_k^{-1} & 0
0 & 0 & 1/\vartheta_{k+1}
\end{bmatrix}
\]

With (A.41) and \(H^{-T}J_nH = -J_n\), we see that the entries \(v_{k+1}^TJ_nH^{-1}z\) in the third row are zeros (despite the last entry)

(A.46) \[\vartheta_1 \cdot v_{k+1}^TJ_nH^{-1}z = u_{k+1}^TH^TJ_nH^{-1}z = -u_{k+1}^TJ_nv_k = 0,\]

for \(z \in \{y_1, \ldots, y_k, u_1, \ldots, u_{k+1}, x_1, \ldots, x_k, v_1, \ldots, v_k\}\) due to the construction of \(u_{k+1}\) as \(J\)-orthogonal to all columns of \(S_{2k}\). This implies the zeros in the last column of (A.45). For the last entry, we have

\[-\vartheta_{k+1} \cdot v_{k+1}^TJ_nH^{-1}v_{k+1} = -u_{k+1}^TH^TJ_nH^{-1}v_{k+1} = u_{k+1}^TJ_nv_{k+1} = 1.\]

Thus, \(-v_{k+1}^TJ_nH^{-1}v_{k+1} = 1/\vartheta_{k+1}\).

With (A.37) the entries in the upper part of the third column (as well as the entries in the fourth and fifth block of the last row) are zero as

\[
\chi_{k+1} z^TJ_nH^{-1}u_{k+1} = z^TJ_nH^{-1}(Hv_k - \gamma_kyk - \mu_{k+1} - \beta_ku_{k+1} - \alpha_ku_k)
= z^TJ_nv_k - z^TJ_nH^{-1}(\gamma_kyk + \mu_{k+1} + \beta_ku_{k+1} + \alpha_ku_k) = 0
\]

for \(z \in \{x_1, \ldots, x_k, v_1, \ldots, v_k\}\) due to (A.46) and (A.36).

The entries in \(Y_{k+1}^TJ_nH^{-1}u_{k+1}\) are zero as \(H^{-1}\) is Hamiltonian and (A.40) yield

(A.47) \[y_j^TJ_nH^{-1}u_{k+1} = -(H^{-1}y_j)^TJ_nu_{k+1} = -(\psi_{j+1}x_{j+1} - e_{jj}x_j - e_{j-1,j}x_{j-1} - g_{jj}v_j - g_{j,j+1}v_{j+1})^TJ_nu_{k+1} = 0,\]

for \(j = 1, \ldots, k - 1\) due to the construction of \(u_{k+1}\) as \(J\)-orthogonal to all columns of \(S_{2k}\).

With this, we can show in a recursive manner that the entries in

\[
U_{k+1}^TJ_nH^{-1}u_{k+1} = -(H^{-1}U_{k+1})^TJ_nu_{k+1},
\]

are zero by making use of \(\chi_1u_1 = \psi_1x_1 - f_{11}v_1\) and (A.44). First we obtain

(A.48) \[\chi_1 \cdot (H^{-1}u_1)^TJ_nu_{k+1} = (\psi_1x_1 - f_{11}v_1)^TJ_nu_{k+1} = 0,\]
due to the construction of \( u_{k+1} \) as \( J \)-orthogonal to all columns of \( S_{2k} \). Next we observe
\[
\chi_2 \cdot (H^{-1}u_2)^T J_n u_{k+1} = (v_1 - \gamma_1 H^{-1}y_1 - \alpha_1 H^{-1}u_1)^T J_n u_{k+1} = 0,
\]
where the first term is zero as \( u_{k+1} \) is \( J \)-orthogonal to \( v_1 \), the second one due to (A.47) and the third term due to (A.48). Continuing in this fashion, we have
\[
\chi_j \cdot (H^{-1}u_j)^T J_n u_{k+1} = (v_{j-1} - \gamma_{j-1} H^{-1}y_{j-1} - \mu_{j-1} H^{-1}y_{j-2})^T J_n u_{k+1}
= (\beta_j H^{-1}u_{j-2} + \alpha_{j-1} H^{-1}u_{j-1})^T J_n u_{k+1} = 0,
\]
where the first term is zero as \( u_{k+1} \) is \( J \)-orthogonal to \( v_{j-1} \), the second and third one due to (A.47), and the fourth and fifth term due to the preceding observations.

Hence, (A.45) holds.

**A.7. Step 2k+2**: range\( \{S_{2k+2}\} = K_{2k+2}(H, u_1) + K_{2k+2}(H^{-1}, H^{-1}u_1) \). Assume that we have constructed \( S_{2k+1} = [Y_k \ U_{k+1} \ | \ X_k \ V_{k+1}] \in \mathbb{R}^{2n \times 4k+2} \) as in the previous section.

The two vectors \( H^{-(2k+1)}u_1 \) and \( H^{-(2k+2)}u_1 \) from \( K_{2k+2}(H^{-1}, H^{-1}u_1) \) are added to the symplectic basis. Due to the previous construction, this is achieved by constructing \( x_{k+1} \) from \( H^{-1}y_k \) and \( y_{k+1} \) from \( H^{-1}x_{k+1} \). First \( H^{-1}y_k \) is \( J \)-orthogonalized against the columns of \( S_{2k+1} \):
\[
w_x = (I - S_{2k+1} J_{2k+1}^T S_{2k+1}^T J_n) H^{-1} y_k = H^{-1} y_k - [X_k \ V_{k+1} \ - Y_k \ - U_{k+1}]
\]
\[
= H^{-1} y_k - e_{kk} x_k - e_{k-1,k} x_{k-1} - g_{kk} v_{k} - g_{k+1,k} v_{k+1}
\]
due to (A.45). Normalizing \( w_x \) to length 1 gives
\[(A.49) \quad x_{k+1} = w_x / \psi_{k+1}, \]
where we assume that \( \psi_{k+1} = \| w_x \|_2 \neq 0 \).

This step is finalized by \( J \)-orthogonalizing \( H^{-1}x_{k+1} \) against the columns of \( S_{2k+1} \):
\[
w_y = (I - S_{2k+1} J_{2k+1}^T S_{2k+1}^T J_n) H^{-1} x_{k+1} = H^{-1} x_{k+1} - [X_k \ V_{k+1} \ - Y_k \ - U_{k+1}]
\]
\[
= H^{-1} x_{k+1} - Y_k \cdot J_{2k+1} \]
\[
\]
All entries \( z^T J_n H^{-1} x_{k+1} = -(H^{-1} z)^T J_n x_{k+1} \) in the last vector are zero. In order to see this, let us first consider \( z = v_j, j = 1, \ldots, k + 1 \). Due to \( v_j^T v_j = H u_j \), we have immediately
\[(H^{-1} v_j)^T J_n x_{k+1} = -u_j^T J_n x_{k+1} / \theta_j = 0. \]

Next, we consider \( z = x_j, j = 1, \ldots, k \), and make use of \( \xi_j y_j = H^{-1} x_j \) to obtain
\[(H^{-1} x_j)^T J_n x_{k+1} = \zeta_j y_j^T J_n x_{k+1} = 0. \]
Rewriting (A.40) in terms of $H^{-1}y_j$, the case $z = y_j, j = 1, \ldots, k$ yields
\[
(H^{-1}y_j)^T J_n x_{k+1} = (\psi_j x_j - e_{j-1,j-1} x_{j-1} - g_{j-1,j-1} v_{j-1} - g_{j-1,j} v_j)^T J_n x_{k+1} = 0.
\]
Finally, for $z = u_j$, we obtain from (A.15)
\[
(H^{-1}u_j)^T J_n x_{k+1} = (\psi_1 x_1 - f_{11} v_1)^T J_n x_{k+1} = 0,
\]
from (A.24)
\[
(H^{-1}u_2)^T J_n x_{k+1} = (v_1 + \gamma_1 H^{-1} y_1 + \alpha_1 H^{-1} u_1)^T J_n x_{k+1}/\chi_2 = 0,
\]
and from (A.37)
\[
(H^{-1}u_{j+1})^T J_n x_{k+1} = (v_j + \gamma_j H^{-1} y_j + \mu_j y_{j-1} + \beta_j u_{j-1} + \alpha_j H^{-1} u_j)^T J_n x_{k+1}/\chi_{j+1} = 0
\]
for $j = 2, \ldots, k$.

Thus,
\[
y_{k+1} = H^{-1} x_{k+1}/\xi_{k+1},
\]
where we assume that
\[
\xi_{k+1} = (H^{-1} x_{k+1})^T J_n x_{k+1} = x_{k+1}^T H^{-1} J_n x_{k+1} \neq 0.
\]
With the same argument as in (A.19), we see that
\[
\delta_{k+1} = -\frac{1}{\xi_{k+1}}.
\]

Let $S_{2k+2} = [y_{k+1} Y_k u_{k+1} | x_{k+1} X_k V_{k+1}] \in \mathbb{R}^{2n \times 4k+4}$. Then by construction $S_{2k+2}^T J_n S_{2k+2} = J_{2k+2}$ and range$(S_{2k+2}) = K_{2k+2}(H, u_1) + K_{2k+2}(H^{-1}, H^{-1} u_1)$.

**A.7.1. The projected matrix** $H_{2k+2} = J_{2k+2}^T S_{2k+2}^T J_n H S_{2k+2}$. Most of the entries in
\[
H_{2k+2} = J_{2k+2}^T S_{2k+2}^T J_n H S_{2k+2} = \begin{bmatrix}
H_{(11)}^{(2k+2)} & H_{(12)}^{(2k+2)} \\
H_{(21)}^{(2k+2)} & H_{(22)}^{(2k+2)}
\end{bmatrix},
\]
with
\[
H_{(11)}^{(2k+2)} = \begin{bmatrix}
-x_{k+1}^T J_n H y_{k+1} & -x_{k+1}^T J_n H Y_k & -x_{k+1}^T J_n H U_{k+1} \\
-x_{k+1}^T J_n H y_{k+1} & 0 & 0 \\
-x_{k+1}^T J_n H y_{k+1} & 0 & 0
\end{bmatrix},
\]
\[
H_{(12)}^{(2k+2)} = \begin{bmatrix}
-x_{k+1}^T J_n H x_{k+1} & -x_{k+1}^T J_n H X_k & -x_{k+1}^T J_n H V_{k+1} \\
-x_{k+1}^T J_n H x_{k+1} & 0 & 0 \\
-x_{k+1}^T J_n H x_{k+1} & 0 & 0
\end{bmatrix},
\]
\[
H_{(21)}^{(2k+2)} = \begin{bmatrix}
y_{k+1}^T J_n H y_{k+1} & y_{k+1}^T J_n H Y_k & y_{k+1}^T J_n H U_{k+1} \\
y_{k+1}^T J_n H y_{k+1} & 0 & 0 \\
y_{k+1}^T J_n H y_{k+1} & 0 & 0
\end{bmatrix},
\]
\[
H_{(22)}^{(2k+2)} = \begin{bmatrix}
y_{k+1}^T J_n H x_{k+1} & y_{k+1}^T J_n H X_k & y_{k+1}^T J_n H V_{k+1} \\
y_{k+1}^T J_n H x_{k+1} & 0 & 0 \\
y_{k+1}^T J_n H x_{k+1} & 0 & 0
\end{bmatrix},
\]
are already known from (A.43) (denoted in blue).
Next we show that

\[ H_{2k+2} = \begin{bmatrix}
0 & 0 & 0 & \lambda_{k+1} & 0 & \cdots & 0 & \gamma_{k+1} \\
0 & 0 & 0 & 0 & \Delta_k & B_{k,k+1} \\
0 & 0 & 0 & \gamma_{k+1} & 0 & B^T_{k,k+1} & T_{k+1} \\
\delta_{k+1} & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \Delta_k & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \Theta_{k+1} & 0 & 0 & 0 & 0 \\
\end{bmatrix} \]

(A.51)

Making use of (A.50) we obtain

\[ z^T J_n H y_{k+1} = \delta_{k+1} z^T J_n x_{k+1} = 0 \]

for all but two of the entries in the first column, that is, for \( z = x_1, \ldots, x_{k+1}, v_1, \ldots, v_{k+1}, y_1, \ldots, y_k, u_1, \ldots, u_{k+1} \). This gives the zeros in the fourth row as well.

For the entries \( x^T_{k+1} J_n H z \) in the first row, we note that with (A.49) and \( H^{-T} J_n H = J^T \),

\[ x^T_{k+1} J_n H z = \psi_{k+1}(H^{-1} y_k - e_{kk} x_k - e_{k-1,k} x_{k-1} - g_{k-1,k} v_{k+1} - g_{kk} v_k) J_n H z = 0, \]

for \( z = y_1, \ldots, y_k, u_1, \ldots, u_{k+1}, x_1, \ldots, x_{k-2}, v_1, \ldots, v_{k-2} \) due to (A.43) and \( S^T_{2k-1} J_n S_{2k+1} = J_{2k+1} \). Next, with \( H v_j = \chi_{j+1} u_{j+1} + \gamma_j y_j + \mu_j y_{j-1} + \beta_k u_{j-1} - \alpha_j u_j \) (A.44), it follows for \( j = k-1, k, k-1 \) that

\[ x^T_{k+1} J_n H v_{k-2} = x^T_{k+1} J_n H v_{k-1} = x^T_{k+1} J_n H v_k = 0, \]

as \( S^T_{2k-1} J_n S_{2k+1} = J_{2k+1} \). With this and (A.49), we obtain three more zero entries

\[ \psi_{k-2} x^T_{k+1} J_n H x_{k-2} = \psi_{k-1} x^T_{k+1} J_n H x_{k-1} = \psi_k x^T_{k+1} J_n H x_k = 0. \]

This gives the zeros in the fourth column as well.

Hence, (A.51) holds.

A.7.2. The projected matrix \( J^T_{2k+2} S^T_{2k+2} J_n H^{-1} S_{2k+2} \). Most of the entries in

\[ \tilde{H}_{2k+2} = J^T_{2k+2} S^T_{2k+2} J_n H^{-1} S_{2k+2} = \begin{bmatrix}
\tilde{H}^{(11)}_{2k+2} & \tilde{H}^{(12)}_{2k+2} \\
\tilde{H}^{(21)}_{2k+2} & \tilde{H}^{(22)}_{2k+2} \\
\end{bmatrix}, \]
with

\[ \hat{H}^{(11)}_{2k+2} = \begin{bmatrix} x^T_{k+1}J_nH^{-1}y_{k+1} & 0 & 0 \\ X_k^TJ_nH^{-1}y_{k+1} & 0 & 0 \\ V_{k+1}^TJ_nH^{-1}y_{k+1} & 0 & 0 \end{bmatrix}, \]

\[ \hat{H}^{(12)}_{2k+2} = \begin{bmatrix} 1/\delta_{k+1} & 0 & 0 \\ 0 & \Delta_k^{-1} & 0 \\ 0 & 0 & \Theta_k^{-1} \end{bmatrix}, \]

\[ \hat{H}^{(21)}_{2k+2} = \begin{bmatrix} -y^T_{k+1}J_nH^{-1}y_{k+1} & -y^T_{k+1}J_nH^{-1}J_{k+1} & -y^T_{k+1}J_nH^{-1}U_{k+1} \\ -y^T_{k+1}J_nH^{-1}y_{k+1} & E_k & G_{k,k+1} \\ -U^T_{k+1}J_nH^{-1}y_{k+1} & G^T_{k,k+1} & F_{k+1} \end{bmatrix}, \]

\[ \hat{H}^{(22)}_{2k+2} = \begin{bmatrix} -y^T_{k+1}J_nH^{-1}x_{k+1} & -y^T_{k+1}J_nH^{-1}X_{k+1} & -y^T_{k+1}J_nH^{-1}V_{k+1} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \]

are already known from (A.45) (denoted in blue). All but one of the zeros in the first row of \( \hat{H}^{(11)}_{2k+2} \) and \( \hat{H}^{(12)}_{2k+2} \) and the first column of \( \hat{H}^{(21)}_{2k+2} \) and \( \hat{H}^{(22)}_{2k+2} \) follow from the derivations in the previous section (denoted in red). Due to (A.50),

\[ x^T_{k+1}J_nH^{-1}y_{k+1} = -(H^{-1}x_{k+1})^TJ_ny_{k+1} = -\xi_{k+1}^Ty_{k+1}^TJ_ny_{k+1} = 0, \]

and the last zero in the first row/fourth columns follows.

Next we will show that

\[ \hat{H}_{2k+2} = \begin{bmatrix} 0 & 0 & 0 & 1/\delta_{k+1} & 0 & 0 \\ 0 & 0 & 0 & 0 & \Delta_k^{-1} & 0 \\ 0 & 0 & 0 & 0 & 0 & \Theta_k^{-1} \\ e_{k+1,k+1} & e_{k,k+1} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ G^T_{k,k+1} & F_{k+1} & 0 & 0 & 0 \end{bmatrix}, \]

(A.52)

Let us consider the first column. We have \( X_k^TJ_nH^{-1}y_{k+1} = 0 \) as for \( j = 1, \ldots, k \)

\[ x^T_{j}J_nH^{-1}y_{k+1} = -(H^{-1}x_{j})^TJ_ny_{k+1} = -\xi_{j}^Ty_{j}^TJ_ny_{k+1} = 0, \]

and \( V_{k+1}^TJ_nH^{-1}y_{k+1} = 0 \) as for \( j = 1, \ldots, k + 1 \)

\[ v^T_{j}J_nH^{-1}y_{k+1} = -(H^{-1}v_{j})^TJ_ny_{k+1} = -u_{j}^Tv_{j}y_{k+1}/\partial_j = 0. \]
The Hamiltonian extended Krylov subspace method

Next, observe that
\[ Y_k^T J_n H^{-1} y_{k+1} = 0 \text{ as for } j = 1, \ldots, k - 1 \]
\[ y_j^T J_n H^{-1} y_{k+1} = \xi_j (H^{-1} x_j)^T J_n H^{-1} y_{k+1} = \xi_j x_j^T J_n y_{k+1} = 0. \]

Finally, making use of (A.44), we observe that
\[ U_k^T J_n H^{-1} y_{k+1} = 0 \text{ as for } j = 1, \ldots, k. \]

Hence, (A.52) holds.
