

Ecology and Behavior of the Coyotes in Jackson Hole
Franz J. Camenzind
Zoology and Physiology
University of Wyoming
Project Number 168

The preliminary work on this project was completed in June, July, and August of 1969, and the second phase was started in February of 1970 and will continue until September of 1971.

The objectives include both ecological and behavioral aspects of the Jackson Hole coyote population. Scat was collected from designated trails as well as from five denning areas. Ten active dens were located and a trapping procedure was initiated with 18 coyotes marked and released to date. Various aspects of social, non-social, and inter-species behavior were observed and described.

Supported by the New York Zoological Society, Grand Teton National Park, and the Theodore Roosevelt Memorial Fund of the American Museum of Natural History.
