Mushroom collecting in the Greater Yellowstone Area was relatively poor during the summer of 1999 due to a cool early season followed by dry weather during the summer. It was perhaps the poorest year of a long term study of Cortinarius, which Meinhard Moser and the late Vera and Kent McKnight began in earnest in the early 1980s; later joined by Joe Ammirati. None-the-less during the season Meinhard Moser was able to paint more than forty-five species for the monograph we are preparing on the Cortinarii of this region. At the end of the season, in late August, some good collections of Cortinarium were made at Sandpoint on Yellowstone Lake, and Lilypad Lake in Yellowstone National Park.

In 1999 we collected in Grand Teton National Park (Taggart Lake, Steamboat Mountain, Reid Mountain, Berol Lodge), Rockefeller Memorial Parkway (Grassy Lake), and Yellowstone National Park (Lewis Lake, Sandpoint on Yellowstone Lake, Lilypad Lake) as well as Bridger-Teton National Forest (Two Oceans Mountain, Lost Lake, Turpin Meadow, Fourmile Meadow, Flagstaff Road, Togwotee Lodge) and Shoshone National Forest (Deception Creek, Togwotee Pass, Brooks Lake, Wind River Spring).

By comparison, the 1997 season was moderately good in some areas but poor in others. None-the-less we found some interesting Cortinarium in 1997 including several new species, Cortinarium citriolens Ammirati & Moser, C. calojanthinus Moser & Ammirati, C. pseudovariegatus Moser, C. variosimilis Moser & Ammirati, C. infractus var. flavus Moser, and C. sannio Moser, and several new records including C. superbus A. H. Smith (see Moser and Ammirati, 1999). Over the years, many Cortinarium have been collected that will be the subject of several papers in the near future. One of us, Michelle Seidl (2000) published on phylogenetic relationships in Cortinarium, subgenus Myxacium, which includes a number of taxa collected in the Greater Yellowstone Area in previous years.

In 1999 two of us, Brandon Matheny and Bradley Kropp, especially collected species of Inocybe, a common ectomycorrhizal genus found
